Legal information

Warning concept

This Manual contains information which you must observe to ensure your own personal safety as well as to avoid material damage. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to equipment damage have no safety alert symbol. Depending on the hazard level, warnings are indicated in a descending order as follows:

 DANGER
indicates that death or serious injury will result if proper precautions are not taken.
 WARNING
indicates that death or serious injury could result if proper precautions are not taken.
 CAUTION
indicates that minor personal injury can result if proper precautions are not taken.
NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one level of danger is simultaneously applicable, the warning notice for the highest level is used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified personnel

The product/system described in this documentation may only be operated by **personnel qualified** for the specific task in accordance with the relevant documentation for the specific task, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

 WARNING
Siemens products are only permitted to be used for the applications envisaged in the catalog and in the associated technical documentation. If third-party products and components are to be used, they must be recommended or approved by Siemens. These products can only function correctly and safely if they are transported, stored, set up, mounted, installed, commissioned, operated and maintained correctly. The permissible ambient conditions must be adhered to. Information in the associated documentation must be observed.

Trademarks

All names identified with ® are registered trademarks of Siemens AG. Any other names used in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of liability

We have verified that the contents of this document correspond to the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. The information given in this document is reviewed at regular intervals and any corrections that might be necessary are made in the subsequent editions.

1.1 General safety instructions

WARNING

Risk of death if the safety instructions and remaining risks are not carefully observed

If the safety instructions and residual risks are not observed in the associated hardware documentation, accidents involving severe injuries or death can occur.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

WARNING

Danger to life or malfunctions of the machine as a result of incorrect or changed parameterization

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY-STOP or EMERGENCY-OFF).

1.2

Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, devices, and/or networks. They are important components of a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

To ensure that Siemens products and solutions are operated securely, suitable preventive measures (e.g. cell protection concept) and each component must be integrated into a state-of-the-art holistic industrial security concept. Third-party products that may be in use should also be considered. You will find more information about industrial security at:

<http://www.siemens.com/industrialsecurity>

To receive information about product updates on a regular basis, register for our product newsletter. You will find more information at:

<http://support.automation.siemens.com>

WARNING

Danger as a result of unsafe operating states resulting from software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can result in death, severe injuries and/or material damage.

- Keep the software up to date.

Information and newsletters can be found at:

<http://support.automation.siemens.com>

- Incorporate the automation and drive components into a holistic, state-of-the-art industrial security concept for the installation or machine.

For more information, visit:

<http://www.siemens.com/industrialsecurity>

- Make sure that you include all installed products into the holistic industrial security concept.

2.1 Overview of parameters

2.1.1 Explanation of the parameter list

Basic structure of the parameter descriptions

The data in the following example have been chosen at random. The table below contains all the information that can be included in a parameter description. Some of the information is optional.

The "List of parameters" (Page 26) has the following structure:

----- **Start of example** -----

pxxxx[0...n]	BICO: Full parameter name / abbreviated name				
CU/PM variants	Access level: 3	Calculated: p0340 = 1		Data type: FloatingPoint32

Notice:	Safety notice without a warning triangle				
Note:	Information that might be useful.				

----- **End of example** -----

The individual pieces of information are described in detail below.

pxxxx[0...n]**Parameter number**

The parameter number is made up of a "p" or "r", followed by the parameter number and the index or bit field (optional).

Examples of the representation in the parameter list:

- p... Adjustable parameters (read and write)
- r... Display parameters (read only)
- p0918 Adjustable parameter 918
- p2051[0...13] Adjustable parameter 2051, indices 0 to 13
- p1001[0...n] Adjustable parameter 1001, indices 0 to n (n = configurable)
- r0944 Display parameter 944
- r2129.0...15 Display parameter 2129 with bit field from bit 0 (smallest bit) to bit 15 (largest bit)

Other examples of notation in the documentation:

- p1070[1] Adjustable parameter 1070, index 1
- p2098[1].3 Adjustable parameter 2098, index 1 bit 3
- p0795.4 Adjustable parameter 795, bit 4

The following applies to adjustable parameters:

The parameter value as delivered is specified under "Factory setting" with the relevant unit in square brackets. The value can be adjusted within the range defined by "Min" and "Max".

The term "linked parameterization" is used in cases where changes to adjustable parameters affect the settings of other parameters.

Linked parameterization can occur, for example, as a result of the following actions and parameters:

- Setting the PROFIBUS telegram (BICO interconnection)
p0922
- Setting component lists
p0230, p0300, p0301, p0400
- Automatically calculating and pre-assigning
p0340, p3900
- Restoring the factory settings
p0970

The following applies to display parameters:

The fields "Min", "Max" and "Factory setting" are specified with a dash "-" and the relevant unit in square parentheses.

Note

The parameter list can contain parameters that are not visible in the expert lists of the particular commissioning software (e.g. parameters for trace functions).

BICO: Full parameter name/Abbreviated name

The following abbreviations can appear in front of the BICO parameter name:

- **BI:** Binector Input
This parameter is used for selecting the source of a digital signal.
- **BO:** Binector Output
This parameter is available as a digital signal for interconnection with other parameters.
- **CI:** Connector Input
This parameter is used for selecting the source of an "analog" signal.
- **CO:** Connector Output
This parameter is available as an "analog" signal for interconnection with other parameters.
- **CO/BO:** Connector/Binector Output
This parameter is available as an "analog" and digital signal for interconnection with other parameters.

Note

A BICO input (BI/CI) cannot be interconnected with just any BICO output (BO/CO, signal source).

When interconnecting a BICO input using the commissioning software, only the corresponding possible signal sources are listed.

Function diagrams 1020 ... 1030 explain the symbols for BICO parameters and how to deal with BICO technology.

CU/PM variants

Indicates for which Control Units (CU) and/or Power Modules (PM) the parameter is valid. If no CU or PM is listed, then the parameter is valid for all variants.

The following information relating to "CU" and "PM" can be displayed under the parameter number:

Table 2-1 Information in the "CU/PM variants" field

CU/PM variants	Meaning
	All Control Units have this parameter.
CU240B-2	CU240B-2
CU240B-2_DP	CU240B-2 with PROFIBUS interface
CU240E-2	CU240E-2
CU240E-2_DP	CU240E-2 with PROFIBUS interface
CU240E-2_DP_F	CU240E-2 with PROFIBUS interface and extended integrated safety functions
CU240E-2_F	CU240E-2 with extended integrated safety functions
CU240E-2_PN	CU240E-2 with PROFINET interface
CU240E-2_PN_F	CU240E-2 with PROFINET interface and extended integrated safety functions

Table 2-1 Information in the "CU/PM variants" field, continued

CU/PM variants	Meaning
PM230	Power Module for pumps and fans (3 AC 400 V)
PM240	Power Module for standard applications with dynamic braking (3 AC 400 V)
PM240-2	Power Module for standard applications with dynamic braking (1 AC / 3 AC 200 V; 3 AC 400 V; 3 AC 600 V)
PM250	Power Module (3 AC 400 V with energy recovery)
PM260	Power Module (3 AC 690 V with energy recovery)
PM340	Power Module for standard applications with dynamic braking (1 AC 200 V)

Access level

Specifies the minimum access level required to be able to display and change the relevant parameter. The required access level can be set using p0003.

The system uses the following access levels:

- 1: Standard (not adjustable, included in p0003 = 3)
- 2: Extended (not adjustable, included in p0003 = 3)
- 3: Expert
- 4: Service

Parameters with this access level are password protected.

Note

Parameter p0003 is CU-specific (belongs to the Control Unit).

A higher access level will also include the functions of the lower levels.

Calculated

Specifies whether the parameter is influenced by automatic calculations.

p0340 determines which calculations are to be performed:

- p0340 = 1 includes the calculations from p0340 = 2, 3, 4, 5.
- p0340 = 2 calculates the motor parameters (p0350 ... p0360, p0625).
- p0340 = 3 includes the calculations from p0340 = 4, 5.
- p0340 = 4 only calculates the controller parameters.
- p0340 = 5 only calculates the controller limits.

Note

For p3900 > 0, p0340 = 1 is also called automatically.

After p1900 = 1, 2, p0340 = 3 is also called automatically.

Parameters with a reference to p0340 after "Calculated" depend on the Power Module being used and the motor. In this case, the values at "Factory setting" do not correspond to the actual values because these values are calculated during the commissioning. This also applies to the motor parameters.

Data type

The information on the data type can consist of the following two items (separated by a slash):

- First item
Data type of the parameter.
- Second item (for binector or connector input only)
Data type of the signal source to be interconnected (binector-/connector output).

Parameters can have the following data types:

- Integer8 I8 8-bit integer number
- Integer16 I16 16-bit integer number
- Integer32 I32 32-bit integer number
- Unsigned8 U8 8 bits without sign
- Unsigned16 U16 16 bits without sign
- Unsigned32 U32 32 bits without sign
- FloatingPoint32 Float 32-bit floating point number

Depending on the data type of the BICO input parameter (signal sink) and BICO output parameter (signal source), the following combinations are possible when creating BICO interconnections:

Table 2-2 Possible combinations of BICO interconnections

	BICO input parameter			
	CI parameter			BI parameter
BICO output parameter	Unsigned32 / Integer16	Unsigned32 / Integer32	Unsigned32 / FloatingPoint32	Unsigned32 / Binary

CO: Integer32	x	x	r2060	–
CO: FloatingPoint32	x	x	x	–
Legend: x : BICO interconnection permitted –: BICO interconnection not permitted rxxxx: BICO interconnection is only permitted for the specified CO parameters				

	BICO input parameter			
	CI parameter			BI parameter
BICO output parameter	Unsigned32 / Integer16	Unsigned32 / Integer32	Unsigned32 / FloatingPoint32	Unsigned32 / Binary
BO: Unsigned8	—	—	—	x
BO: Unsigned16	—	—	—	x
BO: Unsigned32	—	—	—	x
BO: Integer16	—	—	—	x
BO: Integer32	—	—	—	x
BO: FloatingPoint32	—	—	—	—
Legend: <div> x : BICO interconnection permitted —: BICO interconnection not permitted rxxx: BICO interconnection is only permitted for the specified CO parameters </div>				

The "-" sign indicates that the parameter can be changed in any object state and that the change will be effective immediately.

The following states are available:

- Drive commissioning is in progress (p0010 > 0).

The parameter can only be changed in the following drive commissioning settings (p0010 > 0):

- C: Can be changed for all settings $p_{0010} > 0$.
- C(x): Can only be changed for the settings $p_{0010} = x$.

A modified parameter value does not take effect until drive commissioning mode is exited with p0010 = 0.

- Pulses are enabled.

- T Ready T: Ready to run
- The pulses are not enabled and the status "C(x)" is not active.

Scaling

Specification of the reference variable with which a signal value is automatically converted for a BICO interconnection.

The following reference variables are available:

- p2000 ... p2007: Reference speed, reference voltage, etc.
- PERCENT: 1.0 = 100 %
- 4000H: 4000 hex = 100 % (word) or 4000 0000 hex = 100 % (double word)
- p0514: specific normalization

Refer to the description for p0514[0...9] and p0515[0...19] to p0524[0...19]

Dyn. index (dynamic index)

For parameters with a dynamic index [0...n], the following information is specified here:

- Data set (if available).
- Parameter for the number of indices (n = number - 1).

The following information can be contained in this field:

- "CDS, p0170" (Command Data Set, CDS count)

Example:

p1070[0] → main setpoint [command data set 0]

p1070[1] → main setpoint [command data set 1], etc.

- "DDS, p0180" (Drive Data Set, DDS count)
- "EDS, p0140" (Encoder Data Set, EDS count)
- "MDS, p0130" (Motor Data Set, MDS count)
- "PDS, p0120" (Power unit Data Set, PDS count)

Data sets can only be created and deleted when p0010 = 15.

Note

Information on the data sets can be taken from the following references:

Operating Instructions SINAMICS G120 Frequency Converter with CU240B-2 and CU240E-2 Control Units.

Unit group and unit selection

The standard unit of a parameter is specified in square brackets after the values for "Min", "Max", and "Factory setting".

For parameters where the unit can be switched over, the specifications for "Unit group" and "Unit selection" determine the group to which this parameter belongs and with which parameter the unit can be changed over.

Example:

Unit group: 7_1, unit selection: p0505

The parameter belongs to unit group 7_1 and the unit can be changed over using p0505.

All the potential unit groups and possible unit selections are listed below.

Table 2-3 Unit group (p0100)

Function diagram

The parameter is included in this function diagram. The structure of the parameter function and its relationship with other parameters is shown in the specified function diagram.

Parameter values

Min.	Minimum value of the parameter [unit]
Max	Maximum value of the parameter [unit]
Factory setting	Value when delivered [unit] In the case of a binector/connector input, the signal source of the default BICO interconnection is specified. A non-indexed connector output is assigned the index [0]. A different value may be displayed for certain parameters (e.g. p1800) at the initial commissioning stage or when establishing the factory settings. Reason: The setting of these parameters is determined by the operating environment of the Control Unit (e.g. depending on converter type, power unit).

Description

Explanation of the function of a parameter.

Values

Lists the possible values of a parameter.

Recommendation

Information about recommended settings.

Index

The name and meaning of each individual index is specified for indexed parameters.

The following applies to the values (Min, Max, Factory setting) of indexed adjustable parameters:

- Min, Max:

The adjustment range and unit apply to all indices.

- Factory setting:

When all indices have the same factory setting, index 0 is specified with the unit to represent all indices.

When the indices have different factory settings, they are all listed individually with the unit.

Bit field

For parameters with bit fields, the following information is provided about each bit:

- Bit number and signal name
- Meaning for signal states 0 and 1
- Function diagram (FP) (optional).

The signal is shown on this function diagram.

Dependency

Conditions that must be fulfilled in conjunction with this parameter. Also includes special effects that can occur between this parameter and others.

Where necessary, "Refer to:" indicates the following information:

- List of other relevant parameters to be considered.
- List of faults and alarms to be considered.

Safety guidelines

2.1.2 Number ranges of parameters

Note

The following number ranges represent an overview for all the parameters available for the SINAMICS drive family.

The parameters for the product described in this List Manual are described in detail in "List of parameters" (Page 26).

Parameters are grouped into the following number ranges:

Table 2-6 Number ranges for SINAMICS

Description:

Operating display for the drive.

Value:

0: Operation - everything enabled
 10: Operation - set "enable setpoint" = "1" (p1142)
 12: Operation - RFG frozen, set "RFG start" = "1" (p1141)
 13: Operation - set "enable RFG" = "1" (p1140)
 14: Operation - MotID, excit. running
 15: Operation - open brake (p1215)
 16: Operation - withdraw braking with OFF1 using "ON/OFF1" = "1"
 17: Operation - braking with OFF3 can only be interrupted with OFF2
 18: Operation - brake on fault, remove fault, acknowledge
 19: Operation - DC braking active (p1230, p1231)
 21: Ready for operation - set "Operation enable" = "1" (p0852)
 22: Ready for operation - de-magnetizing running (p0347)
 31: Ready for switching on - set "ON/OFF1" = "0/1" (p0840)
 35: Switching-on inhibited - carry out first commissioning (p0010)
 41: Switching-on inhibited - set "ON/OFF1" = "0" (p0840)
 42: Switching-on inhibited - set "OC/OFF2" = "1" (p0844, p0845)
 43: Switching-on inhibited - set "OC/OFF3" = "1" (p0848, p0849)
 44: Switching-on inhibited - supply STO terminal w/ 24 V (hardware)
 45: Switching-on inhibited - rectify fault, acknowledge fault, STO
 46: Switching-on inhibited - exit commissioning mode (p0010)
 70: Initialization
 200: Wait for booting/partial booting

Dependency:

Description:

Sets the access level to read and write parameters.

Value:

3: Expert
 4: Service

Note:

A higher set access level also includes the lower one.
 Access level 3 (experts):
 Expert know-how is required for these parameters (e.g. BICO parameterization).
 Access level 4 (service):
 For these parameters, it is necessary that authorized service personnel enter the appropriate password (p3950).

r0018	Control Unit firmware version / CU FW version		
	Access level: 3 Can be changed: - Unit group: - Min 0	Calculated: - Scaling: - Unit selection: - Max 4294967295	Data type: Unsigned32 Dyn. index: - Func. diagram: - Factory setting -
Description:	Displays the firmware version of the Control Unit.		
Dependency:	Refer to: r0197, r0198		
Note:	Example: The value 1010100 should be interpreted as V01.01.01.00.		
r0020	Speed setpoint smoothed / n_set smth		
	Access level: 2 Can be changed: - Unit group: 3_1 Min - [rpm]	Calculated: - Scaling: p2000 Unit selection: p0505 Max - [rpm]	Data type: FloatingPoint32 Dyn. index: - Func. diagram: 5020, 6799 Factory setting - [rpm]
Description:	Displays the currently smoothed speed setpoint at the input of the speed controller or U/f characteristic (after the interpolator).		
Dependency:	Refer to: r0060		
Note:	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The speed setpoint is available smoothed (r0020) and unsmoothed (r0060).		
r0021	CO: Actual speed smoothed / n_act smooth		
	Access level: 2 Can be changed: - Unit group: 3_1 Min - [rpm]	Calculated: - Scaling: p2000 Unit selection: p0505 Max - [rpm]	Data type: FloatingPoint32 Dyn. index: - Func. diagram: 6799 Factory setting - [rpm]
Description:	Display of the calculated and smoothed rotor speed. Frequency components from the slip compensation (for induction motors) are not included.		
Dependency:	Refer to: r0022, r0063		
Note:	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The speed actual value is available smoothed (r0021, r0022) and unsmoothed (r0063).		
r0022	Speed actual value rpm smoothed / n_act rpm smooth		
	Access level: 3 Can be changed: - Unit group: - Min - [rpm]	Calculated: - Scaling: p2000 Unit selection: - Max - [rpm]	Data type: FloatingPoint32 Dyn. index: - Func. diagram: 6799 Factory setting - [rpm]
Description:	Display of the calculated and smoothed rotor speed. Frequency components from the slip compensation (for induction motors) are not included. r0022 is identical to r0021, however, it always has units of rpm and contrary to r0021 cannot be changed over.		
Dependency:	Refer to: r0021, r0063		

Note: Smoothing time constant = 100 ms
 The signal is not suitable as a process quantity and may only be used as a display quantity.
 The speed actual value is available smoothed (r0021, r0022) and unsmoothed (r0063).

r0024	Output frequency smoothed / f_outp smooth		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: p2000	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: 6300, 6799
	Min	Max	Factory setting
	- [Hz]	- [Hz]	- [Hz]

Description: Display of the smoothed output frequency.
 Frequency components from the slip compensation (for induction motors) are included.

Dependency: Refer to: r0066

Note: Smoothing time constant = 100 ms
 The signal is not suitable as a process quantity and may only be used as a display quantity.
 The output frequency is available smoothed (r0024) and unsmoothed (r0066).

r0025	CO: Output voltage smoothed / U_outp smooth		
	Access level: 2	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: p2001	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: 5730, 6300, 6799
	Min	Max	Factory setting
	- [Vrms]	- [Vrms]	- [Vrms]

Description: Displays the smoothed output voltage of the power unit.

Dependency: Refer to: r0072

Note: Smoothing time constant = 100 ms
 The signal is not suitable as a process quantity and may only be used as a display quantity.
 The output voltage is available smoothed (r0025) and unsmoothed (r0072).

r0026	CO: DC link voltage smoothed / Vdc smooth		
	Access level: 2	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: p2001	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: 6799
	Min	Max	Factory setting
	- [V]	- [V]	- [V]

Description: Displays the smoothed actual value of the DC link voltage.

Dependency: Refer to: r0070

Notice: When measuring a DC link voltage < 200 V, for the Power Module a valid measured value is not supplied. In this case, when an external 24 V power supply is connected, a value of approx. 24 V is displayed in the display parameter.

Note: Smoothing time constant = 100 ms
 The signal is not suitable as a process quantity and may only be used as a display quantity.
 The DC link voltage is available smoothed (r0026) and unsmoothed (r0070).
 r0026 sets itself to the lower value of the pulsating DC link voltage.

r0027	CO: Absolute actual current smoothed / I_act abs val smth		
	Access level: 2	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: p2002	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: 5730, 6799, 8850, 8950
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]

Description: Displays the smoothed absolute actual current value.

Dependency: Refer to: r0068

2 Parameters

2.2 List of parameters

Notice: This smoothed signal is not suitable for diagnostics or evaluation of dynamic operations. In this case, the unsmoothed value should be used.

Note: Smoothing time constant = 300 ms
The signal is not suitable as a process quantity and may only be used as a display quantity.
The absolute current actual value is available smoothed (r0027) and unsmoothed (r0068).

r0028	Modulation depth smoothed / Mod_depth smth	
Access level: 4	Calculated: -	Data type: FloatingPoint32

Unit group: -	Unit selection: -	Func. diagram: 5730, 6799, 8950
Min	Max	Factory setting
- [%]	- [%]	- [%]
Description:	Displays the smoothed actual value of the modulation depth.	
Dependency:	Refer to: r0074	
Note:	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The modulation depth is available smoothed (r0028) and unsmoothed (r0074).	

r0029	Current actual value field-generating smoothed / Id_act smooth	
Access level: 4	Calculated: -	Data type: FloatingPoint32

Unit group: -	Unit selection: -	Func. diagram: 6799
Min	Max	Factory setting
- [Arms]	- [Arms]	- [Arms]
Description:	Displays the smoothed field-generating actual current.	
Dependency:	Refer to: r0076	
Note:	Smoothing time constant = 300 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The field-generating current actual value is available smoothed (r0029) and unsmoothed (r0076).	

r0030	Current actual value torque-generating smoothed / Iq_act smooth	
Access level: 4	Calculated: -	Data type: FloatingPoint32

Unit group: -	Unit selection: -	Func. diagram: 6799
Min	Max	Factory setting
- [Arms]	- [Arms]	- [Arms]
Description:	Displays the smoothed torque-generating actual current.	
Dependency:	Refer to: r0078	
Note:	Smoothing time constant = 300 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The torque-generating current actual value is available smoothed (r0030) and unsmoothed (r0078).	

r0031	Actual torque smoothed / M_act smooth	
Access level: 2	Calculated: -	Data type: FloatingPoint32
Can be changed: -	Scaling: p2003	Dyn. index: -
Unit group: 7_1	Unit selection: p0505	Func. diagram: 5730, 6799
Min	Max	Factory setting
- [Nm]	- [Nm]	- [Nm]
Description:	Displays the smoothed torque actual value.	
Dependency:	Refer to: r0080	
Note:	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The torque actual value is available smoothed (r0031) and unsmoothed (r0080).	

r0032	CO: Active power actual value smoothed / P_actv_act smth		
	Access level: 2	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: r2004	Dyn. index: -
	Unit group: 14_10	Unit selection: p0505	Func. diagram: 5730, 6799, 8750, 8850, 8950
	Min - [kW]	Max - [kW]	Factory setting - [kW]
Description:	Displays the smoothed actual value of the active power.		
Dependency:	Refer to: r0082		
Notice:	This smoothed signal is not suitable for diagnostics or evaluation of dynamic operations. In this case, the unsmoothed value should be used.		
Note:	Power delivered at the motor shaft. The active power is available smoothed (r0032 with 100 ms) and unsmoothed (r0082).		
r0033	Torque utilization smoothed / M_util smooth		
	Access level: 4	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: PERCENT	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: 8012
	Min - [%]	Max - [%]	Factory setting - [%]
Description:	Displays the smoothed torque utilization as a percentage. The torque utilization is obtained from the required smoothed torque in reference to the torque limit, scaled using p2196.		
Dependency:	This parameter is only available for vector control. For U/f control r0033 = 0 %.		
Note:	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. The torque utilization is available smoothed (r0033) and unsmoothed (r0081). For M_set total (r0079) > 0, the following applies: - Required torque = M_set total - Actual torque limit = M_max upper effective (r1538) For M_set total (r0079) <= 0, the following applies: - Required torque = - M_set total - Actual torque limit = - M_max lower effective (r1539) For the actual torque limit = 0, the following applies: r0033 = 100 % For the actual torque limit < 0, the following applies: r0033 = 0 %		
r0034	CO: Motor utilization thermal / Mot_util therm

Description:	Display and connector output for the motor utilization from motor temperature model 1 (I2t) or 3. For motor temperature model 1 (I2t) (p0612.0 = 1), the following applies: For firmware version < 4.7 SP6 or p0612.12 = 0: - r0034 = (motor model temperature - 40 K) / (p0605 - 40 K) * 100 % From firmware version 4.7 SP6 and p0612.12 = 1: - r0034 = (motor model temperature - p0613) / (p0605 - p0613) * 100 % For motor temperature model 3 (p0612.2 = 1), the following applies: - r0034 = (motor model temperature - p5397) / (p5398 - p5397) * 100 %		

Dependency:	<p>The thermal motor utilization is only determined when the motor temperature model 1 (I2t) or 3 is activated.</p> <p>The following conditions are a prerequisite for additional information.</p> <ul style="list-style-type: none"> - a temperature sensor has not been parameterized (p0600, p0601). - the current corresponds to the stall current (p0318). - speed $n > 1$ [rpm]. <p>For firmware version < 4.7 SP6 or $p0612.12 = 0$, the following applies:</p> <ul style="list-style-type: none"> - the temperature model operates with an ambient temperature of $20\text{ }^{\circ}\text{C}$. <p>A motor utilization of 100% is displayed ($r0034 = 100\%$) when the following conditions are permanently fulfilled:</p> <ul style="list-style-type: none"> - the ambient temperature is $40\text{ }^{\circ}\text{C}$ (model 1: $p0625 = 40\text{ }^{\circ}\text{C}$, model 3: $p0613 = 40\text{ }^{\circ}\text{C}$). <p>From firmware version 4.7 SP6 and $p0612.12 = 1$, the following applies:</p> <ul style="list-style-type: none"> - the ambient temperature can be adapted to the conditions using p0613. <p>Refer to: p0605, p0611, p0612, p0613, p0627, r0632</p> <p>Refer to: F07011, A07012</p>		
Notice:	<p>After the drive is switched on, the system starts to determine the motor temperature with an assumed model value. This means that the value for the motor utilization is only valid after a stabilization time.</p>		
Note:	<p>Smoothing time constant = 100 ms</p> <p>The signal is not suitable as a process quantity and may only be used as a display quantity.</p> <p>For $r0034 = -200.0\%$, the following applies:</p> <p>The value is invalid (e.g. the motor temperature model is not activated or has been incorrectly parameterized).</p>

Description: Display and connector output for the energy values at the output terminals of the power unit.

Index: [0] = Energy balance (sum)
[1] = Energy drawn
[2] = Energy fed back

Dependency: Refer to: p0043

Note: The signal can be displayed as process variable (scaling: 1 = 1 Wh).
This is enabled in p0043.
The display is also reset with p0040 = 1.
If an enable is present in r0043 when the Control Unit powers up, then the value from r0039 is transferred into r0042.
As r0039 serves as a reference signal for r0042, due to format reasons, the process energy display can only process values of r0039 up to 2147483 kWh. r0039 should also be reset using this value.

Dependency:	Refer to: r0002				

Note:

The value r0046 = 0 indicates that all enable signals for this drive are present.

Bit 00 = 1 (enable signal missing), if:

- the signal source in p0840 is a 0 signal.
- there is a "switching-on inhibited".

Bit 01 = 1 (enable signal missing), if:

- the signal source in p0844 or p0845 is a 0 signal.

Bit 02 = 1 (enable signal missing), if:

- the signal source in p0848 or p0849 is a 0 signal.

Bit 03 = 1 (enable signal missing), if:

- the signal source in p0852 is a 0 signal.

Bit 04 = 1 (DC brake active) when:

- the signal source in p1230 has a 1 signal.

Bit 08 = 1 (enable signal missing), if:

- safety functions have been enabled and STO is active.
- STO is selected via onboard terminals or PROFIsafe.
- a safety-relevant signal is present with STOP A response.
- the "STO via terminals at the Power Module" function is selected.

Bit 10 = 1 (enable signal missing), if:

- the signal source in p1140 is a 0 signal.

Bit 11 = 1 (enable signal missing) if the speed setpoint is frozen, because:

- the signal source in p1141 is a 0 signal.
- the speed setpoint is entered from jogging and the two signal sources for jogging, bit 0 (p1055) and bit 1 (p1056) have a 1 signal.

Bit 12 = 1 (enable signal missing), if:

- the signal source in p1142 is a 0 signal.

Bit 16 = 1 (enable signal missing), if:

- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching-on inhibited" withdrawn with OFF1 = 0.

Bit 17 = 1 (enable signal missing), if:

- commissioning mode is selected (p0010 > 0).
- there is an OFF2 fault response.
- the drive is not operational.

Bit 18 = 1 (enable signal missing), if:

- OFF3 has still not been completed or an OFF3 fault response is present.

Bit 19 = 1 (internal pulse enable missing), if:

- sequence control does not have a finished message.

Bit 20 = 1 (internal DC brake active), if:

- the drive is not in the state "Operation" or in "OFF1/3".
- the internal pulse enable is missing (r0046.19 = 0).

Bit 21 = 1 (enable signal missing), if:

- the power unit does not issue an enable signal (e.g. because DC link voltage is too low).
- the holding brake opening time (p1216) has still not expired.
- the hibernation mode is active.

Bit 26 = 1 (enable signal missing), if:

- the drive is not operational.

Bit 27 = 1 (enable signal missing), if:

- de-magnetization not completed.

Bit 28 = 1 (enable signal missing), if:

- the holding brake is closed or has still not been opened.

Bit 30 = 1 (speed controller inhibited), if one of the following reasons is present:

- the pole position identification is active.
- motor data identification is active (only certain steps).

Bit 31 = 1 (enable signal missing), if:

- the speed setpoint from jog 1 or 2 is entered.

2 Parameters

2.2 List of parameters

Dependency:	The parameter is preset when commissioning the system for the first time and for the factory setting, depending on the power unit that is connected. Depending on the setting, the ability to see control parameters is restricted depending on the particular application. The following applies for p0096 > 0: The motor data identification routine is preset (p1900 = 12). After the motor data identification, the system immediately goes into operation. The following applies for p0096 = 1: The motor type (p0300) synchronous or reluctance motor is not possible.
Note:	When changing p0096 to 1 or 2, when completing commissioning, fast parameterization should be executed (p3900 > 0). Depending on the setting, after quick commissioning and/or automatic parameterization, the procedure for motor data identification as well as the setting of the operating mode and parameterization of the closed-loop control must be appropriately adapted.

Description:	Defines whether the motor and drive converter power settings (e.g. rated motor power, p0307) are expressed in [kW] or [hp]. Depending on the selection, the rated motor frequency (p0310) is either set to 50 Hz or 60 Hz. For p0100 = 0, 2, the following applies: The power factor (p0308) should be parameterized. For p0100 = 1, the following applies: The efficiency (p0309) should be parameterized.		
Value:	0: IEC-Motor (50 Hz, SI units) 1: NEMA motor (60 Hz, US units) 2: NEMA motor (60 Hz, SI units)		
Dependency:	If p0100 is changed, all of the rated motor parameters are reset. Only then are possible unit changeovers made. The units of all motor parameters are changed that are involved in the selection of IEC or NEMA (e.g. r0206, p0307, r0333, r0334, p0341, p0344, r1969). Refer to: r0206, p0210, p0300, p0304, p0305, p0307, p0308, p0309, p0310, p0311, p0314, p0320, p0322, p0323, p0335, r0337, p1800		
Note:	The parameter value is not reset when the factory setting is restored (p0010 = 30, p0970).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Motor connection type	Delta	Star	-
	01	Motor 87 Hz operation	Yes	No	-

Dependency: For standard induction motors (p0301 > 10000), bit 0 is automatically pre-assigned the connection type of the selected data set.
For p0100 > 0 (60 Hz rated motor frequency), it is not possible to select bit 1.
Refer to: p0304, p0305, p1082

Note: For bit 00:
When changing the bits, the rated motor voltage p0304 and the rated motor current p0305 are automatically converted to the selected connection type (star/delta).
For bit 01:
87 Hz operation is only possible in the delta connection type. When selected, the maximum speed p1082 is automatically pre-assigned for a maximum output frequency of 87 Hz.

Description:	Sets the drive unit supply voltage (rms value of the phase-to-phase line supply voltage).		
Dependency:	Set p1254, p1294 (automatic detection of the Vdc switch-on levels) = 0. The switch-in thresholds of the Vdc_max controller (r1242, r1282) are then directly determined using p0210.		
Notice:	If, in the switched-off state (pulse inhibit), the supply voltage is higher than the entered value, the Vdc controller may be automatically de-activated in some cases to prevent the motor from accelerating the next time the system is switched on. In this case, an appropriate alarm A07401 is output.		

2 Parameters

2.2 List of parameters

Note: Setting ranges for p0210 as a function of the rated power unit voltage:

U_{rated} = 230 V:

- p0210 = 200 ... 240 V

U_{rated} = 400 V:

- p0210 = 380 ... 480 V

U_{rated} = 690 V:

- p0210 = 660 ... 690 V

p0219	Braking resistor braking power / R_{brake} P_{brake}

	Min	Max	Factory setting
	0.00 [kW]	20000.00 [kW]	0.00 [kW]
Description:	Sets the braking power of the connected braking resistor.		
Dependency:	Refer to: p1127, p1240, p1280, p1531		
Note:	When setting a value for the braking power, the following calculations are made: - p1240, p1280: Vdc _{max} control is de-activated. - p1531 = - p0219: the power limit when generating is set (limited to - p1530). - the minimum ramp-down time is calculated (p1127) as a function of p0341, p0342 and p1082 (not for vector control with speed encoder). If the parameter is reset again to zero, then the Vdc _{max} controller is reactivated and the power limit as well as the ramp-down time are recalculated.		

p0230	Drive filter type motor side / Drv filt type mot

	Can be changed: C(1, 2)	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	4	0
Description:	Sets the type of the filter at the motor side.		
Value:	0: No filter 1: Motor reactor 2: dv/dt filter 3: Sine-wave filter Siemens 4: Sine-wave filter third-party		
Dependency:	The following parameters are influenced using p0230: p0230 = 1: --> p0233 (power unit, motor reactor) = filter inductance p0230 = 3: --> p0233 (power unit, motor reactor) = filter inductance --> p0234 (power unit sine-wave filter capacitance) = filter capacitance --> p0290 (power unit overload response) = inhibit pulse frequency reduction --> p1082 (maximum speed) = F _{max} filter / pole pair number --> p1800 (pulse frequency) >= nominal pulse frequency of the filter --> p1802 (modulator modes) = space vector modulation without overcontrol		

p0230 = 4:

--> p0290 (power unit overload response) = inhibit pulse frequency reduction

--> p1802 (modulator modes) = space vector modulation without overcontrol

The user must set the following parameters according to the data sheet of the sine-wave filter and also the user must check whether they are permitted.

--> p0233 (power unit, motor reactor) = filter inductance

--> p0234 (power unit sine-wave filter capacitance) = filter capacitance

--> p1082 (maximum speed) = Fmax filter / pole pair number

--> p1800 (pulse frequency) >= nominal pulse frequency of the filter

Refer to: p0233, p0234, p0290, p1082, p1800, p1802

Note: The parameter cannot be changed if the power unit (e.g. PM260) is equipped with an internal sine-wave filter.

For sine-wave filters, the test pulse evaluation to detect short-circuits is always de-activated.

If a filter type cannot be selected, then this filter type is not permitted for the power unit.

p0230 = 1:

Power units with output reactor are limited to output frequencies of 150 Hz.

p0230 = 3:

Power units with sine-wave filter are limited to output frequencies of 200 Hz.

Unit group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
0.000 [mH]	1000.000 [mH]	0.000 [mH]

Description: Enter the inductance of a filter connected at the power unit output.

Dependency: This parameter is automatically pre-set when you select a filter via p0230 if a SIEMENS filter is defined for the power unit.

Refer to: p0230

Note: When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0) and then the controller calculation (p0340 = 3) is carried out.
The parameter cannot be changed if the power unit has an internal sine-wave filter.

p0234

Power unit sine-wave filter capacitance / PU sine filter C

Unit group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
0.000 [μF]	1000.000 [μF]	0.000 [μF]

Description: Enters the capacitance of a sine-wave filter connected at the power unit output.

Dependency: This parameter is automatically pre-set when you select a filter via p0230 if a SIEMENS filter is defined for the power unit.

Refer to: p0230

2 Parameters

2.2 List of parameters

Note: The parameter value includes the sum of all of the capacitances of a phase connected in series (phase - ground).
When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0).
The parameter cannot be changed if the power unit has an internal sine-wave filter.

0.0 [%]	100.0 [%]	[0] 6.0 [%] [1] 16.0 [%]	

Description: Sets the shutdown thresholds for the ground fault monitoring.
The setting is made as a percentage of the maximum current of the power unit (r0209).

Index: [0] = Threshold at which precharging starts
[1] = Threshold at which precharging stops

Dependency: Refer to: p1901
Refer to: F30021

Note: This parameter is only relevant for chassis power units.

r0289	CO: Maximum power unit output current / PU I_outp max		
Access level: 3	Calculated: -	Data type: FloatingPoint32

Unit group: -	Unit selection: -	Func. diagram: -	
Min	Max	Factory setting	
- [Arms]	- [Arms]	- [Arms]	

Description: Displays the actual maximum output current of the power unit taking into account derating factors.

p0290	Power unit overload response / PU overld response		
Access level: 3	Calculated: -	Data type: Integer16	
Can be changed: T	Scaling: -	Dyn. index: -	
Unit group: -	Unit selection: -	Func. diagram: 8021	
Min	Max	Factory setting	
0	13	2	

Description: Sets the response to a thermal overload condition of the power unit.
The following quantities can result in a response to thermal overload:
- heat sink temperature (r0037[0]).
- chip temperature (r0037[1]).
- power unit overload I2t (r0036).
Possible measures to avoid thermal overload:
- reduce the output current limit r0289 and r0067 (for closed-loop speed or torque control) or the output frequency (for U/f control) indirectly via the output current limit and the intervention of the current limiting controller).
- reduce the pulse frequency.
A reduction, if parameterized, is always realized after an appropriate alarm is output.

Value:	0: Reduce output current or output frequency 1: No reduction shutdown when overload threshold is reached 2: Reduce I _{output} or f _{output} and f _{pulse} (not using I _{2t}) 3: Reduce the pulse frequency (not using I _{2t}) 12: I _{output} or f _{output} and automatic pulse frequency reduction 13: Automatic pulse frequency reduction
Dependency:	If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only responses can be selected without pulse frequency reduction (p0290 = 0, 1). For a thermal power unit overload, an appropriate alarm or fault is output, and r2135.15 or r2135.13 set. Refer to: r0036, r0037, p0230, r2135 Refer to: A05000, A05001, A07805
Notice:	If the thermal overload of the power unit is not sufficiently reduced by the actions taken, the drive is always shut down. This means that the power unit is always protected irrespective of the setting of this parameter.
Note:	The setting p0290 = 0, 2 is only practical if the load decreases with decreasing speed (e.g. for applications with variable torque such as for pumps and fans). Under overload conditions, the current and torque limit are reduced, and therefore the motor is braked and forbidden speed ranges (e.g. minimum speed p1080 and suppression [skip] speeds p1091 ... p1094) can be passed through. For p0290 = 2, 3, 12, 13, the I _{2t} overload detection of the power unit does not influence the response "Reduce pulse frequency". When the motor data identification routine is selected, p0290 cannot be changed. For short-circuit/ground fault detection, when the test pulse evaluation is active via p1901 "Test pulse evaluation configuration", the pulse frequency at the instant of switch on is briefly reduced.

p0292[0...1]	Power unit temperature alarm threshold / PU T_{alarm} thresh

	0 [°C]	25 [°C]	[0] 5 [°C] [1] 15 [°C]
Description:	Sets the alarm threshold for power unit overtemperatures. The value is set as a difference to the tripping (shutdown) temperature. Drive: If this threshold is exceeded, an overload alarm is generated and the system responds as parameterized in p0290. Infeed: When the threshold value is exceeded, only an overload alarm is output.

Description:

Selecting the motor type.

The first digit of the parameter value always defines the general motor type and corresponds to the third-party motor belonging to a motor list:

1 = induction motor

2 = synchronous motor

xx = motor without code number

xxx = motor with code number

The type information must be entered to filter motor-specific parameters and to optimize the operating characteristics and behavior. For example, for synchronous motors, power factor (p0308) is neither used nor displayed (in the BOP/IOP).

The following applies for values < 100:

Motor data must be manually entered.

The following applies for values >= 100:

Motor data are automatically loaded from an internal list.

Value:

0: No motor

1: Induction motor

2: Synchronous motor

Dependency:	Code numbers can only be selected for motor types that correspond to the motor type selected in p0300. Refer to: p0300		
Note:	The motor code number can only be changed if the matching catalog motor was first selected in p0300. When selecting a catalog motor (p0300 >= 100), drive commissioning can only be exited if a code number is selected. If a change is made to a non-catalog motor, then the motor code number should be reset (p0301 = 0).

	Can be changed: C(1, 3)	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	1	50	1
Description:	Sets the number (count) of motors that can be operated in parallel using one motor data set. Depending on the motor number entered, internally an equivalent motor is calculated. The following should be observed in motors connected in parallel: Rating plate data should only be entered for one motor: p0305, p0307 The following parameters are also only valid for one motor: p0320, p0341, p0344, p0350 ... p0361 All other motor parameters take into account the replacement/equivalent motor (e.g. r0331, r0333). For motors connected in parallel, external thermal protection should be provided for each individual motor. Refer to: r0331, r0370, r0373, r0374, r0376, r0377, r0382		
Recommendation:	The motors to be connected in parallel must be of the same type and size (same order no. (MLFB)).		
Dependency:	The mounting regulations when connecting motors in parallel must be carefully maintained!		
Caution:	The number of motors set must correspond to the number of motors that are actually connected in parallel. After changing p0306, it is imperative that the control parameters are adapted (e.g. using automatic calculation with p0340 = 1, p3900 > 0). For induction motors that are connected in parallel, but which are not mechanically coupled with one another, then the following applies: - an individual motor must not be loaded beyond its stall point.		
			
Notice:	If p0306 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is appropriately pre-assigned.		
Note:	Only operation with U/f characteristic makes sense if more than 10 identical motors are connected in parallel.

	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0.000	1.000	0.000
Description:	Sets the rated motor power factor (cos phi, rating plate). For a parameter value of 0.000, the power factor is internally calculated and displayed in r0332.		

Dependency:	This parameter is only available for p0100 = 0, 2. Refer to: p0100, p0309, r0332
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.
Note:	The parameter is not used for synchronous motors (p0300 = 2xx). Once the Control Unit has booted for the first time or if the factory settings have been restored, the parameter is pre-assigned to match the power unit.

Unit group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
0.0 [%]	99.9 [%]	0.0 [%]

Description: Sets the rated motor efficiency (rating plate).
For a parameter value of 0.0, the power factor is internally calculated and displayed in r0332.

Dependency: This parameter is only visible for NEMA motors (p0100 = 1, 2).
Refer to: p0100, p0308, r0332

Note: The parameter is not used for synchronous motors.

p0310[0...n] Rated motor frequency / Mot f Rated

Unit group: -	Unit selection: -	Func. diagram: 6301
Min	Max	Factory setting
0.00 [Hz]	650.00 [Hz]	0.00 [Hz]

Description: Sets the rated motor frequency (rating plate).

Dependency: The number of pole pairs (r0313) is automatically re-calculated when the parameter is changed (together with p0311), if p0314 = 0.
The rated frequency is restricted to values between 1.00 Hz and 650.00 Hz.
Refer to: p0311, r0313, p0314

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected.
Information in p0300 should be carefully observed when removing write protection.
If p0310 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. The pre-assignment has been completed if the status display r3996 returns to zero.

Note: Once the Control Unit has been booted up for the first time or if the factory settings have been defined accordingly, the parameter is defined in accordance with the power unit.

p0311[0...n] Rated motor speed / Mot n Rated

Unit group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
0.0 [rpm]	210000.0 [rpm]	0.0 [rpm]

Description: Sets the rated motor speed (rating plate).
For p0311 = 0, the rated motor slip of induction motors is internally calculated and displayed in r0330.
It is especially important to correctly enter the rated motor speed for vector control and slip compensation for U/f control.

Dependency: If p0311 is changed and for p0314 = 0, the pole pair (r0313) is re-calculated automatically.
Refer to: p0310, r0313, p0314

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected.
Information in p0300 should be carefully observed when removing write protection.
If p0311 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. The pre-assignment has been completed if the status display r3996 returns to zero.

Description:	Displays the number of motor pole pairs. The value is used for internal calculations. r0313 = 1: 2-pole motor r0313 = 2: 4-pole motor, etc.		
Dependency:	For p0314 > 0, the entered value is displayed in r0313. For p0314 = 0, the pole pair number (r0313) is automatically calculated from the rated power (p0307), rated frequency (p0310) and rated speed (p0311). Refer to: p0307, p0310, p0311, p0314		
Note:	For the automatic calculation, the pole pair number is set to the value of 2 if the rated speed or the rated frequency is zero.		

p0314[0...n]	Motor pole pair number / Mot pole pair No.		
	Access level: 3	Calculated: -	Data type: Unsigned16
	Can be changed: C(1, 3)	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min 0	Max 255	Factory setting 0
Description:	Sets the motor pole pair number. p0314 = 1: 2-pole motor p0314 = 2: 4-pole motor, etc.		
Dependency:	For p0314 = 0, the pole pair number is automatically calculated from the rated frequency (p0310) and the rated speed (p0311) and displayed in r0313.		
Notice:	If p0314 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. For induction motors, it is only necessary to enter the value if the rated motor slip is so high that the pole pair number r0313, obtained when making the calculation based on the rated frequency and rated speed, is too low.		

p0316[0...n]	Motor torque constant / Mot k_T

Description:	Sets the torque constant of the synchronous motor.		

	p0316 = 0: The torque constant is calculated from the motor data.
	p0316 > 0: The selected value is used as torque constant.
Dependency:	Refer to: r0334
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.
Note:	This parameter is not used for induction motors (p0300 = 1xx).

Description:	Induction motors: Sets the rated motor magnetizing current. For p0320 = 0.000 the magnetizing current is internally calculated and displayed in r0331. Synchronous motors: Sets the rated motor short-circuit current.		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	The magnetizing current p0320 for induction motors is reset when quick commissioning is exited with p3900 > 0. If, for induction motors, the magnetizing current p0320 is changed outside the commissioning phase (p0010 > 0), then the magnetizing inductance p0360 is changed so that the EMF r0337 remains constant.		

p0322[0...n]	Maximum motor speed / Mot n_max

Description:	Sets the maximum motor speed.		
Dependency:	Refer to: p1082		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. If p0322 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly.		
Note:	The parameter has no significance for a value of p0322 = 0.

Description:	Sets the maximum permissible motor current (e.g. de-magnetizing current for synchronous motors).		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. If p0323 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is pre-assigned accordingly.		
Note:	The parameter has no effect for induction motors. The parameter has not effect for synchronous motors if a value of 0.0 is entered. The user-selectable current limit is entered into p0640.		
p0325[0...n]	Motor pole position identification current 1st phase / Mot PolID I 1st ph		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: U, T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0.000 [Arms]	10000.000 [Arms]	0.000 [Arms]
Description:	Sets the current for the 1st phase of the two-stage technique for pole position identification routine. The current of the 2nd phase is set in p0329. The two-stage technique is selected with p1980 = 4.		
Dependency:	Refer to: p0329, p1980, r1984, r1985, r1987 Refer to: F07969		
Notice:	When the motor code (p0301) is changed, it is possible that p0325 is not pre-assigned. p0325 can be pre-assigned using p0340 = 3.		
Note:	The value is automatically pre-assigned for the following events: - For p0325 = 0 and automatic calculation of the closed-loop control parameters (p0340 = 1, 2, 3). - for quick commissioning (p3900 = 1, 2, 3).		
p0326[0...n]	Motor stall torque correction factor / Mot M_stall_corr		
	Access level: 4	Calculated: -	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	5 [%]	300 [%]	100 [%]
Description:	Sets the correction factor for the stall torque/force at a 600 V DC link voltage.		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).		
p0327[0...n]	Optimum motor load angle / Mot phi_load opt		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: 6721
	Min	Max	Factory setting
	0.0 [°]	135.0 [°]	90.0 [°]
Description:	Sets the optimum load angle for synchronous motors with reluctance torque. The load angle is measured at the rated motor current.		

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: This parameter has no significance for induction motors.
For synchronous motors without reluctance torque, a angle of 90 degrees must be set.
When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

p0328[0...n] Motor reluctance torque constant / Mot kT_reluctance

Access level: 3	Calculated: -	Data type: FloatingPoint32
Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
Unit group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
-1000.00 [mH]	1000.00 [mH]	0.00 [mH]

Description: Sets the reluctance torque constant for synchronous motors with reluctance torque (e.g. 1FE ... motors).
This parameter has no significance for induction motors.

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: For synchronous motors without reluctance torque, the value 0 must be set.

p0329[0...n] Motor pole position identification current / Mot PolID current

Access level: 3	Calculated: -	Data type: FloatingPoint32
Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
Unit group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
0.0000 [Arms]	10000.0000 [Arms]	0.0000 [Arms]

Description: Sets the current for the pole position identification routine (p1980 = 1).
For a two-stage technique (p1980 = 4), the current is set here for the 2nd phase.
The current of the 1st phase is set in p0325.

Dependency: If a maximum current (p0323) was not parameterized, then p0329 is limited to the rated motor current.
If p0329 is too small in order to determine the pole position (for p1980 = 1), then p0323 must be first parameterized and significantly greater than p0329.
Refer to: p0325, p1980, r1984, r1985, r1987
Refer to: F07969

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

r0330[0...n] Rated motor slip / Mot slip_rated

Access level: 3	Calculated: -	Data type: FloatingPoint32
Can be changed: -	Scaling: -	Dyn. index: MDS
Unit group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
- [Hz]	- [Hz]	- [Hz]

Description: Displays the rated motor slip.

Dependency: The rated slip is calculated from the rated frequency, rated speed and number of pole pairs.
Refer to: p0310, p0311, r0313

Note: The parameter is not used for synchronous motors (p0300 = 2xx).

	-	-	-
Description:	Displays the rated power factor for induction motors. For IEC motors, the following applies (p0100 = 0): For p0308 = 0, the internally-calculated power factor is displayed. For p0308 > 0, this value is displayed. For NEMA motors, the following applies (p0100 = 1, 2): For p0309 = 0, the internally-calculated power factor is displayed. For p0309 > 0, this value is converted into the power factor and displayed.		
Dependency:	If p0308 is not entered, the parameter is calculated from the rating plate parameters.		
Note:	The parameter is not used for synchronous motors (p0300 = 2xx).		
r0333[0...n]	Rated motor torque / Mot M_rated

Description:	Sets the motor cooling system used.		
Value:	0: Natural ventilation 1: Forced cooling 2: Liquid cooling 128: No fan		
Dependency:	For 1LA7 motors (p0300), the parameter is pre-set as a function of p0307 and p0311.		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	The parameter influences the thermal 3-mass motor model. 1LA7 motors, frame size 56 are operated without fan.		
r0337[0...n]	Rated motor EMF / Mot EMF_rated

Note:

p0340 = 1 contains the calculations of p0340 = 2, 3, 4, 5.

p0340 = 2 calculates the motor parameters (p0350 ... p0360).

p0340 = 3 contains the calculations of p0340 = 4, 5.

p0340 = 4 only calculates the controller parameters.

p0340 = 5 only calculates the controller limits.

When quick commissioning is exited using p3900 > 0, p0340 is automatically set to 1.

At the end of the calculations, p0340 is automatically set to 0.

p0341[0...n]	Motor moment of inertia / Mot M_mom of inert		
	Access level: 3	Calculated: p0340 = 1	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Unit group: 25_1	Unit selection: p0100	Func. diagram: 6020, 6030, 6031
	Min	Max	Factory setting
	0.000000 [kgm²]	100000.000000 [kgm²]	0.000000 [kgm²]
Description:	Sets the motor moment of inertia (without load).		
Dependency:	IEC drives (p0100 = 0): unit kg m² NEMA drives (p0100 = 1): unit lb ft² The parameter value is included, together with p0342, in the rated starting time of the motor. Refer to: p0342, r0345		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	The product of p0341 * p0342 is used when the speed controller (p0340 = 4) is calculated automatically.		
p0342[0...n]	Ratio between the total and motor moment of inertia / Mot MomInert Ratio		
	Access level: 3	Calculated: p0340 = 1	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS

	Min	Max	Factory setting
	1.000	10000.000	1.000
Description:	Sets the ratio between the total moment of inertia/mass (load + motor) and the intrinsic motor moment of inertia/mass (no load).		
Dependency:	This means that together with p0341, the rated starting (accelerating time) of the motor is calculated for a vector drive. Refer to: p0341, r0345, p1498		
Note:	The product of p0341 * p0342 is used when the speed controller (p0340 = 4) is calculated automatically.		
r0343[0...n]	Rated motor current identified / Mot I Rated ident		
	Access level: 4	Calculated: -	Data type: FloatingPoint32

Description:	Displays the identified rated motor current.		

p0344[0...n]	Motor weight (for the thermal motor model) / Mot weight th mod		
	Access level: 3	Calculated: p0340 = 1	Data type: FloatingPoint32
	Can be changed: C(3), T	Scaling: -	Dyn. index: MDS
	Unit group: 27_1	Unit selection: p0100	Func. diagram: -
	Min	Max	Factory setting
	0.0 [kg]	50000.0 [kg]	0.0 [kg]
Description:	Sets the motor weight.		
Dependency:	IEC drives (p0100 = 0): unit kg NEMA drives (p0100 = 1): unit lb		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	The parameter influences the thermal 3 mass model of the induction motor. The parameter is not used for synchronous motors (p0300 = 2xx).		
r0345[0...n]	Nominal motor starting time / Mot t_start_rated		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	- [s]	- [s]	- [s]
Description:	Displays the rated motor starting time. This time corresponds to the time from standstill up to reaching the motor rated speed and the acceleration with motor rated torque (r0333).		
Dependency:	Refer to: r0313, r0333, p0341, p0342		
p0346[0...n]	Motor excitation build-up time / Mot t_excitation		
	Access level: 3	Calculated: p0340 = 1,3	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0.000 [s]	20.000 [s]	0.000 [s]
Description:	Sets the excitation build-up time of the motor. This involves the delay time between enabling the pulses and enabling the ramp-function generator. The induction motor is magnetized during this time.		
Caution:	If there is insufficient magnetization under load or if the acceleration rate is too high, then an induction motor can stall (refer to the note).		
			
Note:	The parameter is calculated using p0340 = 1, 3. For induction motors, the result depends on the rotor time constant (r0384). If this time is excessively reduced, this can result in an inadequate magnetizing of the induction motor. This is the case if the current limit is reached while building up magnetizing. For induction motors, the parameter cannot be set to 0 s (internal limit: 0.1 * r0384). For permanent-magnet synchronous motors and vector control, the value depends on the stator time constant (r0386). Here, it defines the time to establish the current for encoderless operation immediately after the pulses have been enabled.		
p0347[0...n]	Motor de-excitation time / Mot t_de-excitat		
	Access level: 3	Calculated: p0340 = 1,3	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0.000 [s]	20.000 [s]	0.000 [s]
Description:	Sets the de-magnetizing time (for induction motors) after the inverter pulses have been canceled. The inverter pulses cannot be switched in (enabled) within this delay time.		

Note: The parameter is calculated using $p0340 = 1, 3$.
For induction motors, the result depends on the rotor time constant ($r0384$).
if this time is shortened too much, then this can result in an inadequate de-magnetizing of the induction motor and in an overcurrent condition when the pulses are subsequently enabled (only when the flying restart function is activated and the motor is rotating).

p0350[0...n]	Motor stator resistance cold / Mot R_stator cold		
	Access level: 3	Calculated: $p0340 = 1,2$	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0.00000 [ohm]	2000.00000 [ohm]	0.00000 [ohm]
Description:	Sets the stator resistance of the motor at ambient temperature $p0625$ (phase value).		
Dependency:	Refer to: $p0625$, $r1912$		
Notice:	When selecting a catalog motor ($p0301$), this parameter is automatically pre-assigned and is write protected. Information in $p0300$ should be carefully observed when removing write protection.		
Note:	The motor identification routine determines the stator resistance from the total stator resistance minus the cable resistance ($p0352$).		

p0352[0...n]	Cable resistance / R_cable		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0.00000 [ohm]	120.00000 [ohm]	0.00000 [ohm]
Description:	Resistance of the power cable between the power unit and motor.		
Caution:	The cable resistance should be entered prior to motor data identification. If it is used subsequently, the difference by which $p0352$ was changed must be subtracted from the stator resistance $p0350$ or motor data identification must be repeated.		
			
Note:	The parameter influences the temperature adaptation of the stator resistance. The motor identification sets the cable resistance to 20% of the measured total resistance if $p0352$ is zero at the time that the measurement is made. If $p0352$ is not zero, then the value is subtracted from the measured total stator resistance to calculate stator resistance $p0350$. In this case, $p0350$ is a minimum of 10% of the measured value. The cable resistance is reset when quick commissioning is exited with $p3900 > 0$.		

p0354[0...n]	Motor rotor resistance cold / Mot R_r cold		
	Access level: 3	Calculated: $p0340 = 1,2$	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: 6727
	Min	Max	Factory setting
	0.00000 [ohm]	300.00000 [ohm]	0.00000 [ohm]
Description:	Sets the rotor/secondary section resistance of the motor at the ambient temperature $p0625$. This parameter value is automatically calculated using the motor model ($p0340 = 1, 2$) or using the motor data identification routine ($p1910$).		
Dependency:	Refer to: $p0625$		
Notice:	When selecting a catalog motor ($p0301$), this parameter is automatically pre-assigned and is write protected. Information in $p0300$ should be carefully observed when removing write protection.		
Note:	The parameter is not used for synchronous motors ($p0300 = 2$).		

p0356[0...n]	Motor stator leakage inductance / Mot L_stator leak.		
	Access level: 3	Calculated: p0340 = 1,2	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0.00000 [mH]	1000.00000 [mH]	0.00000 [mH]
Description:	Induction machine: sets the stator leakage inductance of the motor. Synchronous motor: Sets the stator quadrature axis inductance of the motor. This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	If the stator leakage inductance (p0356) for induction motors is changed outside the commissioning phase (p0010 > 0), the magnetizing inductance (p0360) is automatically adapted to the new EMF (r0337). You are then advised to repeat the measurement for the saturation characteristic (p1960). For permanent-magnet synchronous motors (p0300 = 2), this is the non-saturated value and is, therefore, ideal for a low current.		
p0357[0...n]	Motor stator inductance d axis / Mot L_stator d		
	Access level: 3	Calculated: p0340 = 1,2	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS

	Min	Max	Factory setting
	0.00000 [mH]	1000.00000 [mH]	0.00000 [mH]
Description:	Sets the stator direct-axis inductance of the synchronous motor. This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).		
Note:	For permanent-magnet synchronous motors (p0300 = 2), this is the non-saturated value and is ideal for a low current.		
p0358[0...n]	Motor rotor leakage inductance / Mot L_rot leak		
	Access level: 3	Calculated: p0340 = 1,2	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: 6727
	Min	Max	Factory setting
	0.00000 [mH]	1000.00000 [mH]	0.00000 [mH]
Description:	Sets the rotor/secondary section leakage inductance of the motor. The value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	If the rotor leakage inductance (p0358) for induction motors is changed outside the commissioning phase (p0010 > 0), then the magnetizing inductance (p0360) is automatically adapted to the new EMF (r0337). You are then advised to repeat the measurement for the saturation characteristic (p1960).		
p0360[0...n]	Motor magnetizing inductance / Mot Lh

	Min	Max	Factory setting
	0.00000 [mH]	10000.00000 [mH]	0.00000 [mH]
Description:	Sets the magnetizing inductance of the motor. This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).		

2 Parameters

2.2 List of parameters

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: The parameter is not used for synchronous motors (p0300 = 2).

p0362[0...n]	Motor saturation characteristic flux 1 / Mot saturat.flux 1		
	Access level: 4	Calculated: -	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: 6723
	Min	Max	Factory setting
	10.0 [%]	800.0 [%]	60.0 [%]
Description:	The saturation characteristics (flux as a function of the magnetizing current) is defined using 4 points. This parameter specifies the y coordinate (flux) for the 1st value pair of the characteristic. Sets the first flux value of the saturation characteristic as a [%] referred to the rated motor flux (100 %).		
Dependency:	The following applies for the flux values: p0362 < p0363 < p0364 < p0365 Refer to: p0366		
Note:	For induction motors, p0362 = 100 % corresponds to the rated motor flux. When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).		
p0363[0...n]	Motor saturation characteristic flux 2 / Mot saturat.flux 2

	Min	Max	Factory setting
	10.0 [%]	800.0 [%]	85.0 [%]
Description:	The saturation characteristics (flux as a function of the magnetizing current) is defined using 4 points. This parameter specifies the y coordinate (flux) for the 2nd value pair of the characteristic. Sets the second flux value of the saturation characteristic as a [%] referred to the rated motor flux (100 %).		
Dependency:	The following applies for the flux values: p0362 < p0363 < p0364 < p0365 Refer to: p0367		
Note:	For induction motors, p0363 = 100 % corresponds to the rated motor flux. When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).		
p0364[0...n]	Motor saturation characteristic flux 3 / Mot saturat.flux 3

	Min	Max	Factory setting
	10.0 [%]	800.0 [%]	115.0 [%]
Description:	The saturation characteristics (flux as a function of the magnetizing current) is defined using 4 points. This parameter specifies the y coordinate (flux) for the 3rd value pair of the characteristic. Sets the third flux value of the saturation characteristic as a [%] referred to the rated motor flux (100 %).		
Dependency:	The following applies for the flux values: p0362 < p0363 < p0364 < p0365 Refer to: p0368		
Note:	For induction motors, p0364 = 100 % corresponds to the rated motor flux. When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

	10.0 [%]	800.0 [%]	125.0 [%]
Description:	The saturation characteristics (flux as a function of the magnetizing current) is defined using 4 points. This parameter specifies the y coordinate (flux) for the 4th value pair of the characteristic. Sets the fourth flux value of the saturation characteristic as a [%] referred to the rated motor flux (100 %).		
Dependency:	The following applies for the flux values: p0362 < p0363 < p0364 < p0365 Refer to: p0369		
Note:	For induction motors, p0365 = 100 % corresponds to the rated motor flux. When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	- [ohm]	- [ohm]	- [ohm]
Description:	Displays the total cable resistance between power unit and motor, as well as the internal converter resistance.		
Dependency:	Refer to: r0238, p0352		

r0373[0...n]	Motor rated stator resistance / Mot R_stator rated		
	Access level: 4	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	- [ohm]	- [ohm]	- [ohm]
Description:	Displays the rated motor stator resistance at rated temperature (total of p0625 and p0627).		
Dependency:	Refer to: p0627		
Note:	The parameter is not used for synchronous motors (p0300 = 2xx).		
r0374[0...n]	Motor rotor resistance cold / Mot R_r cold		
	Access level: 4	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	- [ohm]	- [ohm]	- [ohm]
Description:	Displays the motor rotor resistance at an ambient temperature p0625.		
Dependency:	Refer to: p0625		
Note:	The parameter is not used for synchronous motors (p0300 = 2xx).		
r0376[0...n]	Rated motor rotor resistance / Mot rated R_rotor		
	Access level: 4	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	- [ohm]	- [ohm]	- [ohm]
Description:	Displays the nominal rotor resistance of the motor at the rated temperature. The rated temperature is the sum of p0625 and p0628.		
Dependency:	Refer to: p0628		
Note:	The parameter is not used for synchronous motors (p0300 = 2xx).		
r0377[0...n]	Motor leakage inductance total / Mot L_leak total		
	Access level: 4	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	- [mH]	- [mH]	- [mH]
Description:	Displays the stator leakage inductance of the motor including the motor reactor (p0233).		
r0378[0...n]	Motor stator inductance d axis / Mot L_stator d		
	Access level: 4	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	- [mH]	- [mH]	- [mH]
Description:	Displays the stator longitudinal inductance of the synchronous motor including the motor reactor (p0233).		

r0382[0...n]	Motor magnetizing inductance transformed / Mot L_magn transf		
	Access level: 4	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	- [mH]	- [mH]	- [mH]
Description:	Displays the magnetizing inductance of the motor.		
Note:	The parameter is not used for synchronous motors (p0300 = 2xx).		
r0384[0...n]	Motor rotor time constant / damping time constant d axis / Mot T_rotor/T_Dd		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: 6722
	Min	Max	Factory setting
	- [ms]	- [ms]	- [ms]
Description:	Displays the rotor time constant.		
Note:	The parameter is not used for synchronous motors. The value is calculated from the total of the inductances on the rotor side (p0358, p0360) divided by the rotor resistance (p0354). The temperature adaptation of the rotor resistance for induction motors is not taken into account.		
r0386[0...n]	Motor stator leakage time constant / Mot T_stator leak		
	Access level: 4	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	- [ms]	- [ms]	- [ms]
Description:	Displays the stator leakage time constant.		
Note:	The value is calculated from the total of all leakage inductances (p0233, p0356, p0358) divided by the total of all motor resistances (p0350, p0352, p0354). The temperature adaptation of the resistances is not taken into account.		
r0394[0...n]	Rated motor power / Mot P Rated		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: -	Dyn. index: MDS
	Unit group: 14_6	Unit selection: p0100	Func. diagram: -
	Min	Max	Factory setting
	- [kW]	- [kW]	- [kW]
Description:	Displays the rated motor power.		
Note:	The parameter displays p0307. For p0307 = 0, r0394 is calculated from p0304 and p0305 (only for induction motors). Depending on the actual motor type, deviations can occur from the actual rated motor power.		
r0395[0...n]	Actual stator resistance / R_stator act		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: -	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	- [ohm]	- [ohm]	- [ohm]
Description:	Displays the actual stator resistance (phase value). The parameter value also contains the temperature-independent cable resistance.		
Dependency:	In the case of induction motors the parameter is also affected by the motor temperature model. Refer to: p0350, p0352, p0620		
Note:	In each case, only the stator resistance of the active Motor Data Set is included with the stator temperature of the thermal motor model.		

r0396[0...n]	Actual rotor resistance / R_rotor act				
	Access level: 3	Calculated: -	Data type: FloatingPoint32		
	Can be changed: -	Scaling: -	Dyn. index: MDS		
	Unit group: -	Unit selection: -	Func. diagram: -		
	Min	Max	Factory setting		
	- [ohm]	- [ohm]	- [ohm]		
Description:	Displays the actual rotor resistance (phase value). The parameter is affected by the motor temperature model.				
Dependency:	Refer to: p0354, p0620				
Note:	In each case, only the rotor resistance of the active Motor Data Set is included with the rotor temperature of the thermal motor model. This parameter is not used for synchronous motors (p0300 = 2xx).				

p0422[0...n]	Absolute encoder linear measuring step resolution / Enc abs meas step				
	Access level: 3	Calculated: -	Data type: Unsigned32		
	Can be changed: C(4)	Scaling: -	Dyn. index: EDS		
	Unit group: -	Unit selection: -	Func. diagram: 4704		
	Min	Max	Factory setting		
	0 [nm]	4294967295 [nm]	100 [nm]		
Description:	Sets the resolution of the absolute position for a linear absolute encoder.				
Notice:	This parameter is automatically pre-set for encoders from the encoder list (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.				
Note:	The serial protocol of an absolute encoder provides the position with a certain resolution, e.g. 100 nm. This value must be entered here.				

p0490	Invert measuring probe / Probe inv

CU240E-2_F	Min	Max	Factory setting		
CU240E-2_PN_F	-	-	0000 bin		
CU240E-2_DP_F					
Description:	Setting to invert the digital input signals to connect a measuring probe.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	03	DI 3 (T. 8)	Inverted	Not inverted	-
Dependency:	Refer to: p0580				
Note:	When the measuring probe is inverted, this has no effect on the status displays of the digital inputs (r0721, r0722, r0723).				

p0500	Technology application / Tec application				
PM230	Access level: 4	Calculated: -	Data type: Integer16

	Unit group: -	Unit selection: -	Func. diagram: -		
	Min	Max	Factory setting		
	3	3	3		
Description:	Sets the technology application. The parameter influences the calculation of open-loop and closed-loop control parameters that is e.g. initiated using p0340 = 5.				
Value:	3: Pumps and fans, efficiency optimization				
Dependency:	For p0096 = 1, 2 (Standard, Dynamic Drive Control) p0500 cannot be changed. Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1), "Dynamic Drive Control" (DDC, p0096 = 2)				

2 Parameters

2.2 List of parameters

Notice: If the technological application is set to p0500 = 0 ... 3 during commissioning (p0010 = 1, 5, 30), the operating mode (p1300) is pre-set accordingly.

Note: The calculation of parameters dependent on the technology application can be called up as follows:

- when exiting quick commissioning using p3900 > 0
- when writing p0340 = 1, 3, 5

For p0500 = 3 and when the calculation is initiated, the following parameters are set:

- p1574 = 2 V
- p1580 = 80 % (efficiency optimization)
- p1750.2 = 1: Encoderless control of the induction motor is effective down to zero frequency.
- p1802 = 10 (SVM/FLB with overmodulation and modulation depth reduction over 57 Hz)
- p1803 = 115 %

p0500	Technology application / Tec application		
PM240	Access level: 2	Calculated: -	Data type: Integer16
PM250, PM260	Can be changed: C(1, 5), T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	3	0
Description:	Sets the technology application. The parameter influences the calculation of open-loop and closed-loop control parameters that is e.g. initiated using p0340 = 5.		
Value:	0: Standard drive 1: Pumps and fans 2: Sensorless closed-loop control down to f = 0 (passive loads) 3: Pumps and fans, efficiency optimization		
Dependency:	For p0096 = 1, 2 (Standard, Dynamic Drive Control) p0500 cannot be changed. Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1), "Dynamic Drive Control" (DDC, p0096 = 2)		
Notice:	If the technological application is set to p0500 = 0 ... 3 during commissioning (p0010 = 1, 5, 30), the operating mode (p1300) is pre-set accordingly.		
Note:	The calculation of parameters dependent on the technology application can be called up as follows: - when exiting quick commissioning using p3900 > 0 - when writing p0340 = 1, 3, 5 For p0500 = 0 and when the calculation is initiated, the following parameters are set: - p1574 = 10 V - p1750.2 = 0 - p1802 = 4 (SVM/FLB without overcontrol) (PM240: p1802 = 0, PM260: p1802 = 2) - p1803 = 106 % (PM260: p1803 = 103 %) - p3855 For p0500 = 1 and when the calculation is initiated, the following parameters are set: - p1574 = 2 V - p1750.2 = 0 - p1802 = 4 (SVM/FLB without overcontrol) (PM240: p1802 = 0) - p1803 = 106 % (PM260: p1803 = 103 %) For p0500 = 2 and when the calculation is initiated, the following parameters are set: - p1574 = 2 V (separately-excited synchronous motor: 4 V) - p1750.2 = 1 - p1802 = 4 (SVM/FLB without overcontrol) (PM240: p1802 = 0) - p1803 = 106 % (PM260: p1803 = 103 %) For p0500 = 3 and when the calculation is initiated, the following parameters are set: - p1574 = 2 V - p1750.2 = 1 - p1802 = 4 (SVM/FLB without overcontrol) (PM240: p1802 = 0) - p1803 = 106 % (PM260: p1803 = 103 %)		

For p1750:

The setting of p1750 is only relevant for induction motors.

p1750.2 = 1: Encoderless control of the induction motor is effective down to zero frequency.

This operating mode is possible for passive loads. These include applications where the load does not generate regenerative torque when breaking away and the motor comes to a standstill (zero speed) itself when the pulses are inhibited.

For p1802 / p1803:

p1802 and p1803 are only changed, in all cases, if a sine-wave output filter (p0230 = 3, 4) has not been selected.

p0501	Technological application (standard drive control) / Techn appl SDC		
PM240	Access level: 2	Calculated: -	Data type: Integer16

Description:	Sets the technology application. The parameter influences the calculation of open-loop and closed-loop control parameters that is e.g. initiated using p0340 = 5.		
Value:	0: Constant load (linear characteristic) 1: Speed-dependent load (parabolic characteristic)		
Dependency:	Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2) Refer to: p1300		
Notice:	If the technological application is set to p0501 = 0, 1 during commissioning (p0010 = 1, 5, 30), the operating mode (p1300) is pre-set accordingly.		
Note:	The calculation of parameters dependent on the technology application can be called up as follows: - when exiting quick commissioning using p3900 > 0 - when writing p0340 = 1, 3, 5 For p0501 = 0, 1 and when the calculation is initiated, the following parameters are set: - p1802 = 0 - p1803 = 106 % - p3855.0 = 1 (DC quantity control on) For p1802 / p1803: These parameters are only changed, in all cases, if a sine-wave output filter (p0230 = 3, 4) has not been selected.		
p0502	Technological application (dynamic drive control) / Techn appl DDC		
PM240	Access level: 2	Calculated: -	Data type: Integer16

	Min	Max	Factory setting
	0	5	0
Description:	Sets the technology application for dynamic applications (p0096 = 2). The parameter influences the calculation of open-loop and closed-loop control parameters that is e.g. initiated using p0340 or p3900.		
Value:	0: Standard drive (e.g. pumps, fans) 1: Dynamic starting or reversing 5: Heavy-duty starting (e.g. extruders, compressors)		
Dependency:	The calculation of parameters dependent on the technology application can be called up as follows: - when exiting quick commissioning using p3900 > 0 - when writing p0340 = 1, 3 or 5 Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1) Refer to: p1610, p1750		

Note: When entering p0502 and initiating the calculation, the following parameters are set:

p0502 = 0:

- p1750.0/1/7 = 1 (start and reverse in open-loop control with rugged switchover limits)
- p1610 = 50 %, p1611 = 30 % (low up to average starting torque)

p0502 = 1:

- p1750.0/1/7 = 0 (start and reverse in closed-loop control with shorter acceleration times)
- p1610 = 50 %, p1611 = 30 % (only effective, if the drive is switched-on with a speed setpoint of zero)

p0502 = 5:

- p1750.0/1/7 = 1 (start and reverse in open-loop control with rugged switchover limits)
- p1610 = 80 %, p1611 = 80 % (average up to higher starting torque)

p0505	Selecting the system of units / Unit sys select

Description:	Sets the actual system of units.		
Value:	1: SI system of units 2: System of units referred/SI 3: US system of units 4: System of units referred/US		
Dependency:	The parameter can only be changed in an offline project using the commissioning software.		
Caution:			
Note:			
	If a per unit representation is selected and if the reference parameters (e.g. p2000) are subsequently changed, then the physical significance of several control parameters is also adapted at the same time. As a consequence, the control behavior can change (see p1576, p1621, p1744, p1752, p1755 and p1609, p1612, p1619, p1620).		
	Reference parameter for the unit system % are, for example, p2000 ... p2004. Depending on what has been selected, these are displayed using either SI or US units.		

p0514[0...9]	Scaling-specific reference values / Scal spec ref val

Can be changed:	T	Scaling: -	Dyn. index: -
Unit group:	-	Unit selection: -	Func. diagram: -
Min	0.000001	Max	Factory setting
Description:	Sets the reference values for the specific scaling of BICO parameters. The specific scaling is active when interconnecting with other BICO parameters, and can be used in the following cases: 1. Parameter with the marking "Scaling: p0514". 2. Changing the standard scaling for parameters with the marking "Scaling: p2000" ... "Scaling: p2007". Relative values refer to the corresponding reference value. The reference value corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). To specifically scale BICO parameters, proceed as follows: - set the reference value (p0514[0...9]). - set the numbers of the parameters, which should be active for the scaling, corresponding to the index of p0514 (p0515[0...19] ... p0524[0...19]). For parameters with the marking "Scaling: p0514", which are not entered in p0515[0...19] to p0524[0...19], the reference value 1.0 (factory setting) applies.

2 Parameters

2.2 List of parameters

101 = STANDARD
102 = PERFORMANCE
103 = HIGH PERFORMANCE
104 = ADVANCED LIFETIME

Dependency: Refer to: p0301, p0531, p0532, p1082

Notice: For p0530 = 101, 102, 103, 104, the maximum bearing speed (p0532) is write protected. Write protection is withdrawn with p0530 = 1.

If p0530 is changed during quick commissioning (p0010 = 1), then the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned appropriately. This is not the case when commissioning the motor (p0010 = 3). The maximum speed of the bearing is factored into the limit for the maximum speed p1082.

Note: For a motor with DRIVE-CLiQ, p0530 can only be set to 1.

p0531[0...n] Bearing code number selection / Bearing codeNo sel

PM240	Access level: 3	Calculated: -	Data type: Unsigned16
	Can be changed: C(3)	Scaling: -	Dyn. index: MDS, p0130
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	65535	0

Description: Display and setting the code number of the bearing.

When setting p0301 and p0530 the code number is automatically pre-assigned and is write protected. The information in p0530 should be observed when removing write protection.

Dependency: Refer to: p0301, p0530, p0532, p1082

Notice: If p0531 is changed during quick commissioning (p0010 = 1), then the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned appropriately. This is not the case when commissioning the motor (p0010 = 3). The maximum speed of the bearing is factored into the limit for the maximum speed p1082.

Note: p0531 cannot be changed on a motor with DRIVE-CLiQ.

p0532[0...n] Bearing maximum speed / Bearing n_max

PM240	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: C(1, 3)	Scaling: -	Dyn. index: MDS, p0130
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0.0 [rpm]	210000.0 [rpm]	0.0 [rpm]

Description: Sets the maximum speed of the bearing.

The following applies when calculating the maximum speed (p1082):

- for p0324 = 0 or p0532 = 0, p0322 is used.

- for p0324 > 0 and p0532 > 0, the minimum value from the two parameters is used.

Dependency: Refer to: p0301, p0322, p0530, p1082

Notice: This parameter is pre-assigned in the case of motors from the motor list (p0301) if a bearing version (p0530) is selected.

When selecting a catalog motor, this parameter cannot be changed (write protection). The information in p0530 should be observed when removing write protection.

If p0532 is changed during quick commissioning (p0010 = 1), then the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned appropriately. This is not the case when commissioning the motor (p0010 = 3).

	0	1	0
Description:	Setting to inhibit the calculation of reference parameters (e.g. p2000) when automatically calculating the motor and closed-loop control parameters (p0340, p3900).		
Value:	0: No 1: Yes		
Notice:	The inhibit for the reference value calculation is canceled when new motor parameters (e.g. p0305) are entered and only one drive data set exists (p0180 = 1). This is the case during initial commissioning. Once the motor and control parameters have been calculated (p0340, p3900), the inhibit for the reference value calculation is automatically re-activated.		
Note:	If value = 0: The automatic calculation (p0340, p3900) overwrites the reference parameters. If value = 1: The automatic calculation (p0340, p3900) does not overwrite the reference parameters.

Description: Sets the reference quantity for the technological units.

When changing over using changeover parameter p0595 to absolute units, all of the parameters involved refer to the reference quantity.

Dependency: Refer to: p0595

Notice: When changing over from one technological unit into another, or when changing the reference parameter, a changeover is not made.

p0601[0...n]

Motor temperature sensor type / Mot_temp_sens type

Access level: 2	Calculated: -	Data type: Integer16
Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
Unit group: -	Unit selection: -	Func. diagram: 8016
Min	Max	Factory setting
0	6	0

Description: Sets the sensor type for the motor temperature monitoring.

Value:

0:	No sensor
1:	PTC alarm & timer
2:	KTY84
4:	Bimetallic NC contact alarm & timer
6:	PT1000

Dependency: A thermal motor model is calculated corresponding to p0612.

Caution: For p0601 = 2, 6:

If the motor temperature sensor is not connected but another encoder, then the temperature adaptation of the motor resistances must be switched out (p0620 = 0). Otherwise, in controlled-loop operation, torque errors will occur that will mean that the motor will not be able to be stopped.

Note: For p0601 = 1:

Tripping resistance = 1650 Ohm. Wire breakage and short-circuit monitoring.

Min	Max	Factory setting
0.0 [°C]	240.0 [°C]	130.0 [°C]

Description: Sets the alarm threshold for monitoring the motor temperature for motor temperature model 2 or KTY/PT1000.

After the alarm threshold is exceeded, alarm A07910 is output and timer (p0606) is started.

If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output.

Dependency: Refer to: p0606, p0612
Refer to: F07011, A07910

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: The hysteresis is 2 K.
When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

Min	Max	Factory setting
0.0 [°C]	240.0 [°C]	145.0 [°C]

Description: Sets the threshold and temperature value to monitor the motor temperature.
Temperature model 1 (l2t, p0612.0 = 1):
The following applies for firmware version < 4.7 SP6 or p0612.8 = 0:
- sets the alarm threshold. If the model temperature (r0034) exceeds the alarm threshold, then alarm A07012 is output.
- this value is simultaneously used as rated winding temperature.
The following applies from firmware version 4.7 SP6 and p0612.8 = 1:
- p5390: when commissioning a catalog motor for the first time, p0605 is copied to p5390.
- p5390: p5390 is of significance when evaluating the alarm threshold.
- p5390: the stator winding temperature (r0632) is used to initiate the signal.
- p0627: when a catalog motor is commissioned for the first time, p0605 -40 °C is copied to p0627.
- p0627: p0627 is of significance for the rated temperature.
Motor temperature model 2 (p0612.1 = 1) or measurement:
- sets the fault threshold. If the temperature (r0035) exceeds the fault threshold, then fault F07011 is output.

Dependency: Refer to: r0034, p0606, p0611, p0612
Refer to: F07011, A07012

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.
Motor temperature model 1 (l2t):

The following applies for firmware version < 4.7 SP6 or p0612.8 = 0:

p0605 also defines the final temperature of the model for r0034 = 100 %. Therefore, p0605 has no influence on the time up to alarm A07012 being issued. The time is only determined by time constant p0611, the actual current and the reference value p0318. For p0318 = 0, the rated motor current is used as reference value.

Note: The hysteresis is 2 K.
When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

p0606[0...n] **Mot_temp_mod 2/sensor timer / Mod 2/sens timer**

Access level: 4	Calculated: -	Data type: FloatingPoint32
Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
Unit group: -	Unit selection: -	Func. diagram: 8016
Min	Max	Factory setting
0.000 [s]	600.000 [s]	0.000 [s]

Description: Sets the timer for monitoring the motor temperature for motor temperature model 2 or KTY/PT1000.
This timer is started when the temperature alarm threshold (p0604) is exceeded.
If the timer has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output.
If the temperature fault threshold (p0605) is prematurely exceeded before the timer has expired, then fault F07011 is immediately output.

2 Parameters

2.2 List of parameters

Dependency: Refer to: p0604, p0605
Refer to: F07011, A07910

Note: With p0606 = 0 s, the timer is de-activated and only the fault threshold is effective.
KTY/PT1000: When setting the minimum value, the timer is disabled and a fault is not output until p0605 is exceeded.
PTC, bimetallic NC contact: The timer minimum value has no special significance.

p0607[0...n]	Temperature sensor fault timer / Sensor fault time		
	Access level: 4	Calculated: -	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: 8016
	Min	Max	Factory setting
	0.000 [s]	600.000 [s]	0.100 [s]
Description:	Sets the timer between the output of alarm and fault for a temperature sensor fault. If there is a sensor fault, this timer is started. If the sensor fault is still present after the timer has expired, a corresponding fault is output.		
Notice:	The parameterized time is internally rounded-off to an integer multiple of 48 ms.		
Note:	If the motor is an induction motor, the timer is switched off when setting the minimum value and no alarm is output. Temperature monitoring is then based on the thermal model.		
p0610[0...n]	Motor overtemperature response / Mot temp response		
	Access level: 2	Calculated: -	Data type: Integer16
	Can be changed: C(3), T	Scaling: -	Dyn. index: MDS
	Unit group: -	Unit selection: -	Func. diagram: 8016, 8017, 8018
	Min	Max	Factory setting
	0	12	12
Description:	Sets the system response when the motor temperature reaches the alarm threshold.		
Value:	0: No response only alarm no reduction of I _{max} 1: Messages, reduction of I _{max} 2: Messages, no reduction of I _{max} 12: Messages, no reduction of I _{max} , temperature storage		
Dependency:	Refer to: p0601, p0604, p0605, p0614, p0615 Refer to: F07011, A07012, A07910		
Note:	The I _{max} reduction is not executed for PTC (p0601 = 1) or bimetallic NC contact (p0601 = 4). The I _{max} reduction results in a lower output frequency. If value = 0: An alarm is output and I _{max} is not reduced. If value = 1: An alarm is output and a timer is started. A fault is output if the alarm is still active after this timer has expired. - for KTY/PT1000, the following applies: I _{max} is reduced - for PTC, the following is valid: I _{max} is not reduced If value = 2: An alarm is output and a timer is started. A fault is output if the alarm is still active after this timer has expired. If value = 12: Behavior is always the same as for value 2. For motor temperature monitoring without temperature sensor, when switching off, the model temperature is saved in a non-volatile fashion. When switching on, the same value (reduced by p0614) is taken into account in the model calculation. As a consequence, the UL508C specification is fulfilled.		

p0611[0...n]	I2t motor model thermal time constant / I2t mot_mod T			
	Access level: 3	Calculated: -	Data type: FloatingPoint32	
	Can be changed: C(1, 3), U, T	Scaling: -	Dyn. index: MDS	
	Unit group: -	Unit selection: -	Func. diagram: 8017	
	Min	Max	Factory setting	
	0 [s]	20000 [s]	0 [s]	
Description:	Sets the winding time constant. The time constant specifies the warm-up time of the cold stator winding when loaded with the motor standstill current (rated motor current, if the motor standstill current is not parameterized) up until a temperature rise of 63 % of the continuously permissible winding temperature has been reached.			
Dependency:	The parameter is only used for synchronous motors (p0300 = 2xx, 4) and synchronous reluctance motors (p0300 = 6xx). Refer to: r0034, p0612, p0615 Refer to: F07011, A07012, A07910			
Notice:	This parameter is automatically pre-set from the motor database for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection. When exiting commissioning, p0612 is checked, and where relevant, is pre-assigned to a value that matches the motor power, if a temperature sensor was not parameterized (see p0601).			
Note:	When parameter p0611 is reset to 0, then this switches out the thermal I2t motor model (refer to p0612). If no temperature sensor is parameterized, then the ambient temperature for the thermal motor model is referred to p0625.

Dependency:	For synchronous motors and synchronous reluctance motors, when exiting commissioning, temperature model 1 is automatically activated if a time constant has been entered in p0611. Refer to: r0034, p0604, p0605, p0606, p0611, p0613, p0615, p0625, p0626, p0627, p0628, r0630, r0631, r0632, r0633, p5350, r5389, p5390, p5391 Refer to: F07011, A07012, A07014, A07910				
Notice:	For bit 00: This bit is only automatically activated for permanent-magnet 1FT7 synchronous motors and synchronous reluctance motors. For other permanent-magnet synchronous motors, the user himself must activate motor temperature model 1 (I2t). It is only possible to activate this motor temperature model (I2t) for a time constant greater than zero (p0611 > 0).				
Note:	Mot_temp_mod: motor temperature model For bit 00: This bit is used to activate/de-activate the motor temperature model for permanent-magnet synchronous motors and synchronous reluctance motors. For bit 01 (see also bit 9): This bit is used to activate/de-activate the motor temperature model for induction motors.				

2 Parameters

2.2 List of parameters

For bit 02:

This bit is used to activate/de-activate the motor temperature model for 1FK7 Basic and 1FL5 motors.

Motor temperature model 3 cannot be simultaneously activated with another motor temperature model.

For bit 08:

This bit is used to extend the motor temperature model 1 (I2t).

The following applies for firmware version < 4.7 SP6 (only bit 0):

- this bit has no function. Temperature model 1 operates in the standard mode.

Overtemperature at rated load: p0605 - 40 °C

Alarm threshold: p0605

Fault threshold: p0615

The following applies from firmware version 4.7 SP6 (bits 0 and 8):

- temperature model 1 operates in the extended mode.

Overtemperature at rated load: p0627

Alarm threshold: p5390

Fault threshold: p5391

For bit 09:

This bit is used to extend the motor temperature model 2.

For firmware version < 4.7 following applies (only bit 1):

- this bit has no function. Temperature model 2 operates in the standard mode.

From firmware version 4.7 the following applies (bits 1 and 9):

- this bit should be set. Temperature model 2 then operates in the extended mode and the result of the model is more precise.

For bit 12 (only effective if a temperature sensor has not been parameterized):

This bit is used to set the ambient temperature for the motor temperature model 1 (I2t).

The following applies for firmware version < 4.7 SP6 (only bit 0):

- this bit has no function. Temperature model 1 operates with an ambient temperature of 20 °C.

The following applies from firmware version 4.7 SP6 (bits 0 and 12):

- the ambient temperature can be adapted to the conditions using p0613.

Description:	<p>Selects the identification of the stator resistance after booting the Control Unit (only for vector control).</p>		

2 Parameters

2.2 List of parameters

The identification is used to measure the actual stator resistance and from the ratio of the result of motor data identification (p0350) to the matching ambient temperature (p0625) the actual mean temperature of the stator winding is calculated. The result is used to initialize the thermal motor model.

p0621 = 1:

Identification of the stator resistance only when the drive is switched on for the first time (pulse enable) after booting the Control Unit.

p0621 = 2:

Identification of the stator resistance every time the drive is switched on (pulse enable).

Value:

- 0: No Rs identification
- 1: Rs identification after switching-on again
- 2: Rs identification after switching-on each time

Dependency:

- perform motor data identification (see p1910) with cold motor.
- enter ambient temperature at time of motor data identification in p0625.

Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)

Refer to: p0622, r0623

Notice:

The calculated stator temperature can only be compared with the measured value of a temperature sensor (KTY/PT1000) to a certain extent, as the sensor is usually the warmest point of the stator winding, whereas the measured value of identification reflects the mean value of the stator winding.

Furthermore this is a short-time measurement with limited accuracy that is performed during the magnetizing phase of the induction motor.

Note:

The measurement is carried out:

- For induction motors
- When vector control is active (see p1300)
- if a temperature sensor (KTY/PT1000) has not been connected
- When the motor is at a standstill when switched on

When a flying restart is performed on a rotating motor, the temperatures of the thermal motor model are set to a third of the overtemperatures. This occurs only once, however, when the CU is booted (e.g. after a power failure).

If identification is activated, the magnetizing time is determined via p0622 and not via p0346. Quick magnetizing (p1401.6) is de-energized internally and alarm A07416 is displayed. The speed is enabled after completion of the measurement.

Unit group: -	Unit selection: -	Func. diagram: -	
Min	Max	Factory setting	
0.000 [s]	20.000 [s]	0.000 [s]	
Description:	Sets the excitation time of the motor for the stator resistance identification after switching on again (restart).		
Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1) Refer to: p0621, r0623		
Note:	For p0622 < p0346 the following applies: If identification is activated, the magnetizing time is influenced by p0622. The speed is enabled after measurement is complete, but not before the time in p0346 has elapsed (see r0056 bit 4). The time taken for measurement also depends on the settling time of the measured current. For p0622 >= p0346 the following applies: Parameter p0622 is internally limited to the magnetizing time p0346, so that p0346 represents the maximum possible magnetizing time during identification. The entire measurement period (magnetizing plus measurement settling time plus measuring time) will always be greater than p0346.

Description:	Defines the rated overtemperature of the stator iron referred to ambient temperature in the motor temperature model 2 (p0612.1 = 1).		
Dependency:	For 1LA7 motors (p0300), the parameter is pre-set as a function of p0307 and p0311. Refer to: p0625		
Notice:	When selecting a standard induction motor listed in the catalog (p0300 > 100, p0301 > 10000), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

Description:	Defines the rated overtemperature of the stator winding referred to the ambient temperature. - motor temperature model 1 (I2t, p0612.0 = 1): The following applies for firmware version < 4.7 SP6 or p0612.8 = 0: p0605 is of significance for the rated temperature. The following applies from firmware version 4.7 SP6 and p0612.8 = 1: Overtemperature at the rated operating point. - motor temperature model 2 (p0612.1 = 1): Overtemperature at the rated operating point.		
Dependency:	For 1LA7 motors (p0300), the parameter is pre-set as a function of p0307 and p0311. Refer to: p0625		
Notice:	When selecting a standard induction motor listed in the catalog (p0300 > 100, p0301 > 10000), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300). The signal is not suitable as a process quantity and may only be used as a display quantity.

Description:	The non-linear and cross-coupled quadrature axis flux functions are defined using 4 coefficients. This parameter describes the gradients of the saturated component over the quadrature axis current.		
Dependency:	Refer to: p0634, p0635, p0636		
p0640[0...n]	Current limit / Current limit		
	Access level: 2	Calculated: p0340 = 1	Data type: FloatingPoint32
	Can be changed: C(1, 3), U, T	Scaling: -	Dyn. index: DDS, p0180
	Unit group: -	Unit selection: -	Func. diagram: 6640
	Min	Max	Factory setting
	0.00 [Arms]	10000.00 [Arms]	0.00 [Arms]
Description:	Sets the current limit.		
Dependency:	Refer to: r0209, p0323		
Note:	The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0305. The current limit p0640 is limited to r0209. The resulting current limit is displayed in r0067 and if required, r0067 is reduced by the thermal model of the power unit.		

2 Parameters

2.2 List of parameters

The torque and power limits (p1520, p1521, p1530, p1531) matching the current limit are automatically calculated when exiting the quick commissioning using p3900 > 0 or using the automatic parameterization with p0340 = 3, 5. p0640 is limited to 4.0 x p0305.

p0640 is pre-assigned for the automatic self commissioning routine (e.g. to 1.5 x p0305, with p0305 = r0207[1]). p0640 must be entered when commissioning the system. This is the reason that p0640 is not calculated by the automatic parameterization when exiting the quick commissioning (p3900 > 0).

	Min 0 [h]	Max 4294967295 [h]	Factory setting 0 [h]
Description:	Displays the operating hours for the corresponding motor. The motor operating time counter continues to run when the pulses are enabled. When the pulse enable is withdrawn, the counter is held and the value saved.		
Dependency:	Refer to: p0651 Refer to: A01590		
Note:	For p0651 = 0, the operating hours counter is disabled. The operating hours counter in p0650 can only be reset to 0. The operating hours counter only runs with drive data set 0 and 1 (DDS).		
p0651[0...n]	Motor operating hours maintenance interval / Mot t_op maint

	Unit group: -	Unit selection: -	Func. diagram: -
	Min 0 [h]	Max 150000 [h]	Factory setting 0 [h]
Description:	Sets the service/maintenance intervals in hours for the appropriate motor. An appropriate fault is output when the operating hours set here are reached.		
Dependency:	Refer to: p0650 Refer to: A01590		
Note:	For p0651 = 0, the operating hours counter is disabled. When setting p0651 to 0, then p0650 is automatically set to 0. The operating hours counter only runs with drive data set 0 and 1 (DDS). If there is no temperature monitor, then interconnect to a fixed value. For index 3: When the binector input is interconnected, precharging is switched-on independent of the magnitude of the precharging threshold.

	0	8	[0] 4 [1] 4
Description:	Sets the type of analog inputs. p0756[0...1] = 0, 1, 4 corresponds to a voltage input (r0752, p0757, p0759 are displayed in V). p0756[0...1] = 2, 3 corresponds to a current input (r0752, p0757, p0759 are displayed in mA). In addition, the associated DIP switch must be set. For the voltage input, DIP switch AI0/1 must be set to "U". For the current input, DIP switch AI0/1 or AI2 must be set to "I".		
Value:	0: Unipolar voltage input (0 V ... +10 V) 1: Unipolar voltage input monitored (+2 V ... +10 V) 2: Unipolar current input (0 mA ... +20 mA) 3: Unipolar current input monitored (+4 mA to +20 mA) 4: Bipolar voltage input (-10 V ... +10 V) 8: No sensor connected		
Index:	[0] = AI0 (T. 3/4) [1] = AI1 (T. 10/11)		

Warning:

The maximum voltage difference between analog input terminals AI+, AI-, and the ground must not exceed 35 V. If the system is operated when the load resistor is switched on (DIP switch set to "I"), the voltage between differential inputs AI+ and AI- must not exceed 10 V or the injected 80 mA current otherwise the input will be damaged.

Note:

When changing p0756, the parameters of the scaling characteristic (p0757, p0758, p0759, p0760) are overwritten with the following default values:

For p0756 = 0, 4, p0757 is set to 0.0 V, p0758 = 0.0 %, p0759 = 10.0 V and p0760 = 100.0 %.

For p0756 = 1, p0757 is set to 2.0 V, p0758 = 0.0 %, p0759 = 10.0 V and p0760 = 100.0 %.

For p0756 = 2, p0757 is set to 0.0 mA, p0758 = 0.0 %, p0759 = 20.0 mA and p0760 = 100.0 %.

For p0756 = 3, p0757 is set to 4.0 mA, p0758 = 0.0 %, p0759 = 20.0 mA and p0760 = 100.0 %.

	0	100	0

Description: Sets the number for data transfer of a parameter backup from/to memory card.
Transfer from memory card to device memory (p0804 = 1):
- sets the source of parameter backup (e.g. p0802 = 48 --> PS048xxx.ACX is the source).
Transfer from non-volatile device memory to memory card (p0804 = 2):
- sets the target of parameter backup (e.g. p0802 = 23 --> PS023xxx.ACX is the target).

Dependency: Refer to: p0803, p0804

Note: The volatile device memory is not influenced by data transfer.

Description: Sets the number for data transfer of a parameter backup from/to the non-volatile device memory.
Transfer from memory card to device memory (p0804 = 1):
- sets the target of the parameter backup (e.g. p0803 = 10 --> PS010xxx.ACX is the target).
Transfer from non-volatile device memory to memory card (p0804 = 2):
- sets the source of the parameter backup (e.g. p0803 = 11 --> PS011xxx.ACX is the source).

Value: 0: Source/target standard
10: Source/target with setting 10
11: Source/target with setting 11
12: Source/target with setting 12
30: Source/target with setting 30

Dependency: Refer to: p0802, p0804

Note: The volatile device memory is not influenced by data transfer.

CU240E-2_PN_F	Min	Max	Factory setting
CU240E-2_DP_F	0	1100	0

Description: Sets the transfer direction and start of data transfer between the memory card and non-volatile device memory.
Example 1:
The parameter backup is to be transferred from the non-volatile device memory to the memory card with setting 0.
The parameter backup is to be stored on the memory card with setting 22.
p0802 = 22 (parameter backup stored on memory card as target with setting 22)
p0803 = 0 (parameter backup stored in device memory as source with setting 0)
p0804 = 2 (start data transfer from device memory to memory card)
--> PS000xxx.ACX is transferred from device memory to memory card and stored as PS022xxx.ACX.
--> the parameter backup PS022xxx.ACX on the memory card can be used for data backup.

Example 2:

The parameter backup is to be transferred from the memory card to the non-volatile device memory with setting 22.
The parameter backup is to be stored in the device memory as setting 10.

p0802 = 22 (parameter backup stored on memory card as source with setting 22)

p0803 = 10 (define parameter backup with setting 10 as target in the device memory)

p0804 = 1 (start data transfer from memory card to device memory)

--> PS022xxx.ACX is transferred from memory card to device memory and stored as PS010xxx.ACX.

--> this parameter backup can be loaded to the volatile device memory using p0010 = 30 and p0970 = 10.

--> to permanently save in the device memory and also on the memory card, this parameter backup should be saved using p0971 = 1.

Example 3 (only supported for PROFIBUS/PROFINET):

The PROFIBUS or PROFINET device master data (GSD) should be transferred from the device memory to the memory card.

p0802 = (not relevant)

p0803 = (not relevant)

p0804 = 12 (start transferring the GSD files to the memory card)

--> The GSD files are transferred from the device memory to the memory card and stored in the /SIEMENS/SINAMICS/DATA/CFG directory.

Value:	0: Inactive 1: Memory card to device memory 2: Device memory to memory card 12: Device memory (GSD files) to memory card 1001: File on memory card cannot be opened 1002: File in device memory cannot be opened 1003: Memory card not found 1100: File cannot be transferred
Recommendation:	When switching off/switching on, a possibly valid parameter backup is loaded to the memory card with setting 0. Therefore, we do not recommend parameter backup with setting 0 (p0803 = 0) in the non-volatile device memory.
Dependency:	Refer to: p0802, p0803
Notice:	The memory card must not be removed while data is being transferred. For p0014 = 1, the following applies: After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.
Note:	If a parameter backup with setting 0 is detected on the memory card when the Control Unit is switched on (PS000xxx.ACX), this is transferred automatically to the device memory. When the memory card is inserted, a parameter backup with setting 0 (PS000xxx.ACX) is automatically written to the memory card when the parameters are saved in a non-volatile memory (e.g. by means of "Copy RAM to ROM"). Once the data has been successfully transferred, this parameter is automatically reset to 0. If an error occurs, the parameter is set to a value > 1000. Possible fault causes: p0804 = 1001: The parameter backup set in p0802 as the source on the memory card does not exist or there is not sufficient memory space available on the memory card. p0804 = 1002: The parameter backup set in p0803 as the source in the device memory does not exist or there is not sufficient memory space available in the device memory. p0804 = 1003: No memory card has been inserted.

Description:	Sets the transfer direction and start of data transfer between the memory card and non-volatile device memory.		

Example 1:

The parameter backup is to be transferred from the non-volatile device memory to the memory card with setting 0.
The parameter backup is to be stored on the memory card with setting 22.

p0802 = 22 (parameter backup stored on memory card as target with setting 22)

p0804 = 2 (start data transfer from device memory to memory card)

--> PS000xxx.ACX is transferred from device memory to memory card and stored as PS022xxx.ACX.

--> the parameter backup PS022xxx.ACX on the memory card can be used for data backup.

Example 2:

The parameter backup is to be transferred from the memory card to the non-volatile device memory with setting 22.
The parameter backup is to be stored in the device memory as setting 10.

p0802 = 22 (parameter backup stored on memory card as source with setting 22)

p0803 = 10 (define parameter backup with setting 10 as target in the device memory)

p0804 = 1 (start data transfer from memory card to device memory)

--> PS022xxx.ACX is transferred from memory card to device memory and stored as PS010xxx.ACX.

--> this parameter backup can be loaded to the volatile device memory using p0010 = 30 and p0970 = 10.

--> to permanently save in the device memory and also on the memory card, this parameter backup should be saved using p0971 = 1.

Example 3 (only supported for PROFIBUS/PROFINET):

The PROFIBUS or PROFINET device master data (GSD) should be transferred from the device memory to the memory card.

p0802 = (not relevant)

p0803 = (not relevant)

p0804 = 12 (start transferring the GSD files to the memory card)

--> The GSD files are transferred from the device memory to the memory card and stored in the /SIEMENS/SINAMICS/DATA/CFG directory.

Value:

- 0: Inactive
- 1: Memory card to device memory
- 2: Device memory to memory card
- 1001: File on memory card cannot be opened
- 1002: File in device memory cannot be opened
- 1003: Memory card not found
- 1100: File cannot be transferred

Recommendation:

When switching off/switching on, a possibly valid parameter backup is loaded to the memory card with setting 0. Therefore, we do not recommend parameter backup with setting 0 (p0803 = 0) in the non-volatile device memory.

Dependency:

Refer to: p0802, p0803

Notice:

The memory card must not be removed while data is being transferred.

For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note:

If a parameter backup with setting 0 is detected on the memory card when the Control Unit is switched on (PS000xxx.ACX), this is transferred automatically to the device memory.

When the memory card is inserted, a parameter backup with setting 0 (PS000xxx.ACX) is automatically written to the memory card when the parameters are saved in a non-volatile memory (e.g. by means of "Copy RAM to ROM").

Once the data has been successfully transferred, this parameter is automatically reset to 0. If an error occurs, the parameter is set to a value > 1000. Possible fault causes:

p0804 = 1001:

The parameter backup set in p0802 as the source on the memory card does not exist or there is not sufficient memory space available on the memory card.

p0804 = 1002:

The parameter backup set in p0803 as the source in the device memory does not exist or there is not sufficient memory space available in the device memory.

p0804 = 1003:

No memory card has been inserted.

Description:	Sets the freely-assignable motor number for the drive data set changeover. If the same motor is driven by different drive data sets, the same motor number must also be entered in these data sets. If the motor is also switched with the drive data set, different motor numbers must be used. In this case, the data set can only be switched when the pulse inhibit is set.				
Note:	If the motor numbers are identical, the same thermal motor model is used for calculation after data set changeover. If different motor numbers are used, different models are also used for calculating (the inactive motor cools down in each case). For the same motor number, the correction values of the Rs, Lh or kT adaptation are applied for the data set changeover (refer to r1782, r1787, r1797).

Note:

For bit 02:
A data set changeover is delayed by the time required for the internal parameter calculation.

For bit 04:
A data set changeover is only carried out when the armature short circuit is not activated.

For bit 05:
A data set changeover is only carried out when pole position identification is not running.

For bit 07:
A data set changeover is only carried out when rotating measurement is not running.

For bit 08:
A data set changeover is only carried out when motor data identification is not running.

	01	CDS select. bit 1	ON	OFF	-

Dependency: Refer to: r0050, p0810, p0811

Note: Command data sets are selected via binector input p0810 and following.
The currently effective command data set is displayed in r0050.

Dependency: Refer to: r0051, p0820, p0821

Note: Drive data sets are selected via binector input p0820 and following.
The currently effective drive data set is displayed in r0051.
If there is only one data set, then a value of 0 is displayed in this parameter and not the selection via binector inputs.

Description: Sets the signal source for the command "ON/OFF (OFF1)".

For the PROFIdrive profile, this command corresponds to control word 1 bit 0 (STW1.0).

Recommendation: When the setting for this binector input is changed, the motor can only be switched on by means of an appropriate signal change of the source.

Dependency: Refer to: p1055, p1056

Caution:

When "master control from PC" is activated, this binector input is ineffective.

**Notice:**

For binector input p0840 = 0 signal, the motor can be moved, jogging using binector input p1055 or p1056.

The command "ON/OFF (OFF1)" can be issued using binector input p0840 or p1055/p1056.

For binector input p0840 = 0 signal, the switching-on inhibited is acknowledged.

Only the signal source that originally switched on can also switch off again.

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

Note:

For drives with closed-loop speed control (p1300 = 20), the following applies:

- BI: p0840 = 0 signal: OFF1 (braking with the ramp-function generator, then pulse suppression and switching-on inhibited)

For drives with closed-loop torque control (p1300 = 22), the following applies:

- BI: p0840 = 0 signal: immediate pulse suppression

For drives with closed-loop torque control (activated using p1501), the following applies:

- BI: p0840 = 0 signal: No dedicated braking response, but pulse cancelation when standstill is detected (p1226, p1227)

For drives with closed-loop speed/torque control, the following applies:

- BI: p0840 = 0/1 signal: ON (pulses can be enabled)

Description:	Sets the monitoring time for the power unit. The monitoring time is started after an 0/1 edge of the ON/OFF1 command. If the power unit does not return a READY signal within the monitoring time, fault F07802 is output.		
Dependency:	Refer to: F07802, F30027		
Notice:	The maximum time to precharge the DC link is monitored in the power unit and cannot be changed. The maximum precharging duration depends on the power unit. The monitoring time for the precharging is started after the ON command (BI: p0840 = 0/1 signal). Fault F30027 is output when the maximum precharging duration is exceeded.		
Note:	The factory setting for p0857 depends on the power unit. The monitoring time for the ready signal of the power unit includes the time to precharge the DC link and, if relevant, the de-bounce time of the contactors. If an excessively low value is entered into p0857, then after enable, this results in the corresponding fault.

Recommendation:	When the monitoring is activated (BI: p0860 not equal to r0863.1), then to control the line contactor, signal BO: r0863.1 of its own drive object should be used.		
Dependency:	Refer to: p0861, r0863 Refer to: F07300		
Notice:	The line contactor monitoring is de-activated if the control signal of the particular drive object is set as the signal source for the feedback signal of the line contactor (BI: p0860 = r0863.1).		
Note:	The state of the line contactor is monitored depending on signal BO: r0863.1. When the monitoring is activated (BI: p0860 not equal to r0863.1), fault F07300 is then also output if the contactor is closed before it is controlled using r0863.1.

Description:

Displays or sets the PROFIBUS address for PROFIBUS interface on the Control Unit.

2 Parameters

2.2 List of parameters

The address can be set as follows:

1) Using the DIP switch on the Control Unit.

--> p0918 can then only be read and displays the selected address.

--> A change only becomes effective after a POWER ON.

2) Using p0918

--> Only if all of the DIP switches are set to ON or OFF.

--> The address is saved in a non-volatile fashion using the function "copy from RAM to ROM".

--> A change only becomes effective after a POWER ON.

Notice:

For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

For p0014 = 0, the following applies:

Before a changed setting becomes permanently effective, a non-volatile RAM to ROM data save is required. To do this, set p0971 = 1 or p0014 = 1.

Note:

Permissible PROFIBUS addresses: 1 ... 126

Address 126 is used for commissioning.

Every PROFIBUS address change only becomes effective after a POWER ON.

Refer to: F01505

Note:

For p0922 = 100 ... 199, p2038 is automatically set to 1 and p2038 can no longer be changed. This means that for these telegrams, the "SIMODRIVE 611 universal" interface mode is set and cannot be changed.

If a value is not equal to 999, a telegram is set and the automatically set interconnections in the telegram are inhibited.

The inhibited interconnections can only be changed again after setting value 999.

Description:

The parameter is used to initiate the reset of the drive parameters.

Parameters p0100, p0205 are not reset.

The following motor parameters are defined in accordance with the power unit: p0300 ... p0311.

When downloading settings 10, 11, 12, the buffer memory mode is automatically de-activated (p0014 = 0).

Value:	0: Inactive 1: Start a parameter reset 3: Start download of volatile parameters from RAM 5: Starts a safety parameter reset 10: Start loading the parameters saved with p0971=10 11: Start loading the parameters saved with p0971=11 12: Start loading the parameters saved with p0971=12 30: Start loading the delivery state saved with p0971=30 100: Start a BICO interconnection reset 300: Only Siemens int
Dependency:	Refer to: F01659
Notice:	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0. When the buffer memory is active (see p0014), the actual parameters are backed up from RAM to ROM when a parameter set is loaded (p0970 = 10, 11, 12). Peculiarities of communication via PROFIBUS DP: - Communication with Class 1 masters (e.g. S7 controllers) is interrupted. - Communication with Class 2 masters (e.g. STARTER) is retained.
Note:	A factory setting run can only be started if p0010 was first set to 30 (parameter reset). At the end of the calculations, p0970 is automatically set to 0. Parameter reset is completed with p0970 = 0 and r3996[0] = 0. For p0970 = 5 the following applies: The password for Safety Integrated must be set. When Safety Integrated is enabled, this can result in messages, which then require an acceptance test to be performed. Then save the parameters and carry out a POWER ON. For p0970 = 1 the following applies: If a Safety Integrated function is parameterized (p9601), then the safety parameters are not reset. In this case, a fault (F01659) is output with fault value 2. The following generally applies: One index of parameters p2100, p2101, p2118, p2119, p2126, p2127 is not reset, if a parameterized message is precisely active in this index.

Value:	0: Inactive 1: Save drive object 10: Save in non-volatile memory as setting 10 11: Save in non-volatile memory as setting 11 12: Save in non-volatile memory as setting 12 30: State when delivered, save in non-volatile memory as setting 30		
Dependency:	Refer to: p0970, p1960, p3845, r3996		
Caution:	If a memory card (optional) is inserted – and the USB interface is not used, the following applies: The parameters are also saved on the card and therefore overwrite any existing data!		
			
Notice:	The Control Unit power supply may only be switched off after data has been saved (i.e. after data save has been started, wait until the parameter again has the value 0). Writing to parameters is inhibited while saving. The progress while saving is displayed in r3996. For p0971 = 30: The original state when delivered is overwritten when executing this memory function.		

Note: Parameters saved with p0971 = 10, 11, 12 can be loaded again with p0970 = 10, 11 or 12.
Identification and maintenance data (I&M data, p8806 and following) are only saved for p0971 = 1.

Description:	Sets the required procedure to execute a hardware reset for the drive unit.		
Value:	0: Inactive 1: Hardware-Reset immediate 2: Hardware reset preparation 3: Hardware reset after cyclic communication has failed		
Danger:	It must be absolutely ensured that the system is in a safe condition.		
	The memory card/device memory of the Control Unit must not be accessed.		
Note:	If value = 1: Reset is immediately executed and communications interrupted. After communications have been established, check the reset operation (refer below). If value = 2: Help to check the reset operation. Firstly, set p0972 = 2 and then read back. Secondly, set p0972 = 1 (it is possible that this request is possibly no longer acknowledged). The communication is then interrupted. After communications have been established, check the reset operation (refer below). If value = 3: The reset is executed after interrupting cyclic communication. This setting is used to implement a synchronized reset by a control for several drive units. If cyclic communication is not active, then the reset is immediately executed. After communications have been established, check the reset operation (refer below). To check the reset operation: After the drive unit has been restarted and communications have been established, read p0972 and check the following: p0972 = 0? --> the reset was successfully executed. p0972 = 0? --> the reset was not executed.

Description:	Displays those parameters with a value other than the factory setting for this drive.		
Dependency:	Refer to: r0990, r0999		

Note: Modified parameters are displayed in indices 0 to 98. If an index contains the value 0, then the list ends here. In a long list, index 99 contains the parameter number at which position the list continues.
 This list consists solely of the following parameters:
 r0990[0...99], r0991[0...99] ... r0999[0...99]
 The parameters in this list are not displayed in the expert list of the commissioning software. However, they can be read from a higher-level control system (e.g. PROFIBUS master).

	Unit group: -	Unit selection: -	Func. diagram: 3020
	Min	Max	Factory setting
	-	-	0000 0110 bin

Description: Sets the configuration for the motorized potentiometer.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Data save active	Yes	No	-
	01	Automatic mode ramp-function generator active	Yes	No	-
	02	Initial rounding-off active	Yes	No	-
	03	Save in NVRAM active	Yes	No	-
	04	Ramp-function generator always active	Yes	No	-

Notice: For p0014 = 1, the following applies:
After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note: For bit 00:
0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p1040.
1: The setpoint for the motorized potentiometer is saved after OFF and after ON set to the saved value. In order to save in a non-volatile fashion, bit 03 should be set to 1.
For bit 01:
0: Without ramp-function generator in the automatic mode (ramp-up/ramp-down time = 0).
1: With ramp-function generator in the automatic mode.
For manual operation (0 signal via BI: p1041), the ramp-function generator is always active.
For bit 02:
0: Without initial rounding-off
1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed).
The jerk for the initial rounding-off is independent of the ramp-up time and only depends on the selected maximum speed (p1082). It is calculated as follows:
$$r = 0.01 \% * p1082 [1/s] / 0.13^2 [s^2]$$

The jerk acts up until the maximum acceleration is reached ($a_{max} = p1082 [1/s] / p1047 [s]$), and then the drive continues to run linearly with a constant rate of acceleration. The higher the maximum acceleration (the lower that p1047 is), the longer the ramp-up time increases with respect to the set ramp-up time.
For bit 03:
0: Non-volatile data save de-activated.
1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for bit 00 = 1).
For bit 04:
When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r1050.

	Min	Max	Factory setting
	0.000 [rpm]	210000.000 [rpm]	1500.000 [rpm]
Description:	Sets the highest possible speed. Example: Induction motor p0310 = 50 / 60 Hz without output filter and Blocksize power unit p1082 <= 60 x 240 Hz / r0313 (vector control) p1082 <= 60 x 550 Hz / r0313 (U/f control)		
Dependency:	For vector control, the maximum speed is restricted to 60.0 / (8.333 x 500 µs x r0313). This can be identified by a reduction in r1084. p1082 is not changed in this process due to the fact that the operating mode p1300 can be changed over. If a sine-wave filter (p0230 = 3) is parameterized as output filter, then the maximum speed is limited corresponding to the maximum permissible filter output frequency (refer to the filter data sheet). When using sine-wave filters (p0230 = 3, 4), the maximum speed r1084 is limited to 70% of the resonant frequency of the filter capacitance and the motor leakage inductance. For reactors and dU/dt filters, it is limited to 120 Hz / r0313. Refer to: p0230, r0313, p0322		
Notice:	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.		
Note:	The parameter applies for both motor directions. The parameter has a limiting effect and is the reference quantity for all ramp-up and ramp-down times (e.g. down ramps, ramp-function generator, motor potentiometer). The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0310, p0311, p0322. The following limits are always effective for p1082: p1082 <= 60 x minimum (15 x r0310, 550 Hz) / r0313 p1082 <= 60 x maximum power unit pulse frequency / (k x r0313), with k = 12 (vector control), k = 6.5 (U/f control) During automatic calculation (p0340 = 1, p3900 > 0), the parameter value is assigned the maximum motor speed (p0322). For p0322 = 0 the rated motor speed (p0311) is used as default (pre-assignment) value. For induction motors, the synchronous no-load speed is used as the default value (p0310 x 60 / r0313). For synchronous motors, the following additionally applies: During automatic calculation (p0340, p3900), p1082 is limited to speeds where the EMF does not exceed the DC link voltage. p1082 is also available in the quick commissioning (p0010 = 1); this means that when exiting via p3900 > 0, the value is not changed.

Description:

Sets the ramp-function generator type.

Value:

0: Basic ramp-function generator

1: Extended ramp-function generator

Note:

Another ramp-function generator type can only be selected when the motor is at a standstill.

Description:	Sets the signal source for bypassing the ramp generator (ramp-up and ramp-down times = 0).		
Caution:	If the technology controller is operated in mode p2251 = 0 (technology controller as main speed setpoint), then it is not permissible to disable the interconnection to its status word (r2349).		
			
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	In the case of sensorless vector control, the ramp-function generator must not be bypassed, other than indirectly by means of interconnection with r2349.

Description:	Sets the minimum ramp-down time. The ramp-down time (p1121) is limited internally to this minimum value. The parameter cannot be set shorter than the minimum ramp-up time (p1123).		
Dependency:	Refer to: p1082		

Note: For U/f control and sensorless vector control (see p1300), a ramp-down time of 0 s does not make sense. The setting should be based on the startup times (r0345) of the motor.
 If the maximum speed p1082 changes, p1127 is re-calculated.
 If a braking resistor is connected to the DC link (p0219 > 0), then the minimum ramp-down time is automatically adapted using p1127.

2 Parameters

2.2 List of parameters

Dependency: No effect up to initial rounding-off time (p1130) > 0 s.

Note: p1134 = 0 (continuous smoothing)
If the setpoint is reduced while ramping-up, initially a final rounding-off is carried out and then the ramp-up completed. During the final rounding-off, the output of the ramp-function generator continues to go in the direction of the previous setpoint (overshoot). After the final rounding-off has been completed, the output goes toward the new setpoint.
p1134 = 1 (discontinuous smoothing)
If the setpoint is reduced while ramping-up, then the output goes immediately in the direction of the new setpoint. For the setpoint change there is no rounding-off.

Description:	Sets the ramp-function generator tracking. The output value of the ramp-function generator is tracked (corrected) corresponding to the maximum possible drive acceleration. The reference value is the deviation at the speed controller/velocity controller input that is necessary to ensure that the motor accelerates at the torque/force limit.		
Recommendation:	If at least one speed setpoint filter/velocity setpoint filter is activated (p1414), then the ramp-function generator tracking should be de-activated (p1145 = 0.0). When the speed setpoint filter is activated, the output value of the ramp-function generator can no longer be tracked (corrected) corresponding to the maximum possible drive acceleration. For p1145 = 0.0: This value de-activates the ramp-function generator tracking. For p1145 = 0.0 ... 1.0: Generally, these values are not practical. They cause the motor to accelerate below its torque limit. The lower the selected value, the greater the margin between the controller and torque limit when accelerating. For p1145 > 1.0: The greater the value, the higher the permissible deviation between the speed setpoint and speed actual value.		
Notice:	If ramp-function generator tracking is activated and the ramp time is set too short, this can cause unsteady acceleration. Remedy: - de-activate ramp-function generator tracking (p1145 = 0). - increase the ramp-up/ramp-down time (p1120, p1121).		
Note:	In the U/f mode, ramp-function generator tracking is not active. The speed difference is reduced if the integral component of the speed controller is not maintained when the torque limit is reached (p1400.16 = 1).

2.2 List of parameters

Note: For OFF1/OFF3, the ramp-function generator ramp is effective.
The ramp-function generator is set (to the setpoint (r1170)) and stops the drive corresponding to the ramp-down time (p1121 or p1135). While stopping via the ramp-function generator, STW1.4 is effective (enable ramp-function generator).

p1200[0...n]	Flying restart operating mode / FlyRest op_mode			
	Access level: 2	Calculated: -	Data type: Integer16	
	Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180	
	Unit group: -	Unit selection: -	Func. diagram: 6300	
	Min	Max	Factory setting	
	0	4	0	
Description:	Sets the operating mode for flying restart. The flying restart allows the drive converter to be switched on while the motor is still rotating. In so doing, the drive converter output frequency is changed until the actual motor speed/velocity is found. The motor then accelerates up to the setpoint at the ramp-function generator setting.			
Value:	0: Flying restart inactive 1: Flying restart always active (start in setpoint direction) 4: Flying restart always active (start only in setpoint direction)			
Dependency:	A differentiation is made between flying restart for U/f control and for vector control (p1300). Flying restart, U/f control: p1202, p1203, r1204 Flying restart, vector control: p1202, p1203, r1205 For synchronous motors, flying restart cannot be activated. Refer to: p1201 Refer to: F07330, F07331			
Notice:	The "flying restart" function must be used in cases where the motor may still be running (e.g. after a brief line supply interruption) or is being driven by the load. The system might otherwise shut down as a result of overcurrent.			
Note:	For p1200 = 1, 4, the following applies: Flying restart is active after faults, OFF1, OFF2, OFF3. For p1200 = 1, the following applies: The search is made in both directions. For p1200 = 4, the following applies: The search is only made in the setpoint direction. For U/f control (p1300 < 20), the following applies: The speed can only be sensed for values above approx. 5 % of the rated motor speed. For lower speeds, it is assumed that the motor is at a standstill. If p1200 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1200 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

Description:	Sets the search current for the "flying restart" function. The value is referred to the motor magnetizing current.		
Dependency:	Refer to: r0331		
Caution:	An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.		
			
Note:	In U/f control mode, the parameter serves as a threshold value for establishing the current at the beginning of the flying restart function. When the threshold value is reached, the prevailing search current is set dependent upon the frequency on the basis of voltage inputs. Reducing the search current can also improve flying restart performance (if the system moment of inertia is not very high, for example). For a reluctance motor, the parameter is only changed after the motor data identification has been carried out.

	10 [%]	4000 [%]	150 [%]
Description:	Sets the factor for the search speed for flying restart. The value influences the rate at which the output frequency is changed during a flying restart . A higher value results in a longer search time.		
Recommendation:	For encoderless vector control and motor cables longer than 200 m, set the factor p1203 >= 300 %.		
Caution:	An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.		
	For vector control, a value that is too low or too high can cause flying restart to become unstable.		
Note:	The parameter factory setting is selected so that standard induction motors that are rotating can be found and restarted as quickly as possible (fast flying restart). With this pre-setting, if the motor is not found (e.g. for motors that are accelerated as a result of active loads or with U/f control and low speeds), we recommend that the search rate is reduced (by increasing p1203). For the flying restart of a reluctance motor, the minimum search velocity is limited (p1203 >= 50 %).

Automatic restart faults not active / AR fault not act

Can be changed: U, T	Scaling: -	Dyn. index: -
Unit group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
0	65535	0

Description: Sets faults for which automatic restart should not be effective.

Dependency: The setting is only effective for p1210 = 6, 16, 26.
Refer to: p1210

p1210

Automatic restart mode / AR mode

Access level: 2	Calculated: -	Data type: Integer16
Can be changed: U, T	Scaling: -	Dyn. index: -
Unit group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
0	26	0

Description: Sets the automatic restart mode (AR).
The parameters must be saved in the non-volatile memory p0971 = 1 in order that the setting becomes effective.

Value:	0: Inhibit automatic restart 1: Acknowledge all faults without restarting 4: Restart after line supply failure w/o additional start attempts 6: Restart after fault with additional start attempts 14: Restart after line supply failure following man. acknowledgment 16: Restart after fault following manual acknowledgment 26: Acknowledging all faults and reclosing for an ON command
Recommendation:	For brief line supply failures, the motor shaft may still be rotating when restarting. The "flying restart" function (p1200) might need to be activated to restart while the motor shaft is still rotating.
Dependency:	The automatic restart requires an active ON command (e.g., via a digital input). If, for p1210 > 1, there is no active ON command, then the automatic restart is interrupted. When using an Operator Panel in the LOCAL mode, then there is no automatic start. For p1210 = 14, 16, a manual acknowledgment is required for an automatic restart. Refer to: p0840, p0857 Refer to: F30003
Danger:	 If the automatic restart is activated (p1210 > 1) if there is an ON command (refer to p0840), the drive is switched on as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is present again. This automatic switching-on operation can only be interrupted by withdrawing the ON command.
Notice:	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). When faults are present, therefore, the parameter cannot be changed. For p1210 > 1, the motor is automatically started.
Note:	For p1210 = 1: Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. p1211 has no influence on the number of acknowledgment attempts. For p1210 = 4: An automatic restart is only performed if fault F30003 has occurred on the power unit. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If, for external 24 V power supplies of the Control Unit, additional faults subsequently occur, these are no longer interpreted as line faults and are therefore also not acknowledged. For p1210 = 6: An automatic restart is carried out if any fault has occurred. For p1210 = 14: as for p1210 = 4. However, active faults must be manually acknowledged. For p1210 = 16: as for p1210 = 6. However, active faults must be manually acknowledged. For p1210 = 26: as for p1210 = 6. For this mode, the switch-on command can be entered with a delay. The restart is interrupted with either OFF2 or OFF3. Alarm A07321 is only displayed if the cause of the fault has been removed and the drive is restarted by setting the switch-on command.

p1211	Automatic restart start attempts / AR start attempts		
	Access level: 3	Calculated: -	Data type: Unsigned16
	Can be changed: U, T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	10	3
Description:	Sets the start attempts of the automatic restart function for p1210 = 4, 6, 14, 16, 26.		
Dependency:	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). Refer to: p1210, r1214 Refer to: F07320		
Notice:	After fault F07320 occurs, the switch-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated. After a complete power failure (blackout) the start counter always starts with the counter value that applied before the power failure, and decrements this start attempt by 1. If a further attempt to acknowledge is started by the automatic restart function prior to power failure, e.g. when the CU remains active on power failure longer than the time p1212 / 2, the fault counter will already have been decremented once. In this case, the start counter is thus decreased by the value 2.		

Note: A start attempt starts immediately when a fault occurs. The start attempt is considered to be completed if the motor was magnetized ($r0056.4 = 1$) and an additional delay time of 1 s has expired.

As long as a fault is present, an acknowledge command is generated in the time intervals of $p1212 / 2$. When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgment starts again from the beginning.

Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt, i.e. a fault/error has no longer occurred up to the end of the magnetizing phase, the start counter is again reset to the parameter value after 1 s. If a fault re-occurs - the parameterized number of start attempts is again available.

At least one start attempt is always carried out.

After a line supply failure, acknowledgment is immediate and when the line supply returns, the system is switched on. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgment also causes the start counter to be decremented.

For $p1210 = 26$:
The start counter is decremented if after a successful fault acknowledgment, the on command is present.

Notice:	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).

Description:	Sets the monitoring time of the automatic restart (AR).		
Index:	[0] = Restart [1] = Reset start counter		
Dependency:	Refer to: p1210, r1214		
Notice:	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). After fault F07320 occurs, the switch-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated.		
Note:	For index 0: The monitoring time starts when the faults are detected. If the automatic acknowledgments are not successful, the monitoring time runs again. If, after the monitoring time has expired, the drive has still not successfully started again (flying restart and magnetizing of the motor must have been completed: r0056.4 = 1), then fault F07320 is output. The monitoring is de-activated with p1213 = 0. If p1213 is set lower than the sum of p1212, the magnetizing time p0346 and the additional delay time due to the flying restart, then fault F07320 is generated at each restart. If, for p1210 = 1, the time in p1213 is set lower than in p1212, then fault F07320 is also generated at each restart. The monitoring time must be extended if the faults that occur cannot be immediately and successfully acknowledged (e.g. for faults that are permanently present). In the case of p1210 = 14, 16, the faults which are present must be acknowledged manually within the time in p1213[0]. Otherwise, fault F07320 is generated after the set time.		

For index 1:

The start counter (refer to r1214) is only set back to the starting value p1211 if, after successful restart, the time in p1213[1] has expired. The delay time is not effective for fault acknowledgment without automatic restart (p1210 = 1). After a power failure (blackout) the delay time only starts after the line supply returns and the Control Unit boots. The start counter is set to p1211, if F07320 occurred, the switch-on command is withdrawn and the fault is acknowledged. The start counter is immediately updated if the starting value p1211 or the mode p1210 is changed.

For p1210 = 26, the fault must have been successfully acknowledged and the switch-on command issued within the time in p1213[0]. Otherwise, fault F07320 is generated after the set time.

Note:

For bit 00:

State to display the single initialization after POWER ON.

For bit 01:

State in which the automatic restart function waits for faults (initial state).

For bit 02:

General display that a fault has been identified and that the restart or acknowledgment has been initiated.

For bit 03:

Displays the acknowledge command within the "acknowledge alarms" state (bit 4 = 1). For bit 5 = 1 or bit 6 = 1, the acknowledge command is continually displayed.

For bit 04:

State in which the faults that are present are acknowledged. The state is exited again after successful acknowledgment. A change is only made into the next state if it is signaled that a fault is no longer present after an acknowledgment command (bit 3 = 1).

For bit 05:

State in which the drive is automatically switched on (only for p1210 = 4, 6).

For bit 06:

State in which the system waits after having been switched on, to the end of the start attempt (to the end of the magnetizing process).

For p1210 = 1, this signal is directly set after the faults have been successfully acknowledged.

For bit 07:

State which is assumed after a fault occurs within the automatic restart function. This is only reset after acknowledging the fault and withdrawing the switch-on command.

For bit 10:

When the automatic restart function is active, r1214.7 is displayed, otherwise the active fault r2139.3.

For bits 12 ... 15:

Actual state of the start counter (binary coded).

Value:	0: No motor holding brake available 3: Motor holding brake like sequence control connection via BICO		
Dependency:	Refer to: p1216, p1217, p1226, p1227, p1228		
Caution:	For the setting p1215 = 0, if a brake is used, it remains closed. If the motor moves, this will destroy the brake.		
			
Notice:	If p1215 was set to 3, then when the pulses are suppressed, the brake is closed even if the motor is still rotating. Pulse suppression can either be caused by a 0 signal at p0844, p0845 or p0852 or as a result of a fault with OFF2 response. If this is not desirable (e.g. for a flying restart), then the brake can be kept open using a 1 signal at p0855.		
Note:	if an external motor holding brake is being used, then p1215 should be set to 3 and r0899.12 should be interconnected as control signal. The parameter can only be set to zero when the pulses are inhibited.

Description:	Sets the time to open the motor holding brake. After the holding brake has been controlled (opened), the speed setpoint remains at zero for this time. After this, the speed setpoint is enabled.		

Recommendation:	This time should be set longer than the actual opening time of the brake. This ensures that the drive cannot accelerate when the brake is applied.
Dependency:	Refer to: p1215, p1217
Note:	For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.

Unit group: -	Unit selection: -	Func. diagram: 2701	
Min	Max	Factory setting	
0 [ms]	10000 [ms]	100 [ms]	
Description:	Sets the time to apply the motor holding brake. After OFF1 or OFF3 and the controlling (closing) of the holding brake, the drive remains stationary under closed-loop control for this time with a speed setpoint of zero. The pulses are suppressed when the time expires.		
Recommendation:	This time should be set longer than the actual closing time of the brake. This ensures that the pulses are only suppressed after the brake has closed.		
Dependency:	Refer to: p1215, p1216		
Notice:	If the selected closing time is too short with respect to the actual closing time of the brake, then the load can sag. If the closing time is selected to be too long with respect to the actual closing time of the brake, the control works against the brake and therefore reduces its lifetime.		
Note:	For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.

0.00 [rpm]	210000.00 [rpm]	20.00 [rpm]	
Description:	Sets the speed threshold for the standstill identification. Acts on the actual value and setpoint monitoring. When braking with OFF1 or OFF3, when the threshold is undershot, standstill is identified.		
Dependency:	Refer to: p1227		
Caution:	For closed-loop speed and torque control without encoder, the following applies: If p1226 is set to values under approx. 1 % of the rated motor speed, then the model switchover limits of the vector control must be increased in order to guarantee reliable shutdown (see p1755, p1750.7).		
			
Note:	Standstill is identified in the following cases: - the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired. - the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired. The actual value sensing is subject to measuring noise. For this reason, standstill cannot be detected if the speed threshold is too low.

Description:	Sets the monitoring time for the standstill identification. When braking with OFF1 or OFF3, standstill is identified after this time has expired, after the setpoint speed has fallen below p1226 (also refer to p1145).		
Dependency:	The parameter is pre-assigned depending on the size of the power unit. Refer to: p1226		

2 Parameters

2.2 List of parameters

Notice: For p1145 > 0.0 (RFG tracking) the setpoint is not equal to zero dependent on the selected value. This can therefore cause the monitoring time in p1227 to be exceeded. In this case, for a driven motor, the pulses are not suppressed.

Note: Standstill is identified in the following cases:

- the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired.
- the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired.

For p1227 = 300.000 s the following applies:
Monitoring is de-activated.

For p1227 = 0.000 s, the following applies:
With OFF1 or OFF3 and a ramp-down time = 0, the pulses are immediately suppressed and the motor "coasts" down.
Once the Control Unit has been booted up for the first time or if the factory settings have been defined accordingly, the parameter is defined in accordance with the power unit.

Description:	Setting to activate DC braking.		
Value:	0: No function 4: DC braking 5: DC braking for OFF1/OFF3 14: DC braking below starting speed		
Dependency:	Refer to: p0300, p1232, p1233, p1234, r1239		

Note: The function can only be used for induction motors (p0300 = 1).
 For p1231 = 4:
 The function is activated as soon as the activation criterion is fulfilled.
 - the function can be superseded by an OFF2 response.
 Activation criterion (one of the following criteria is fulfilled):
 - binector input p1230 = 1 signal (DC braking activation, depending on the operating mode).
 - the drive is not in the state "S4: Operation" or in "S5x".
 - the internal pulse enable is missing (r0046.19 = 0).
 DC braking can only be withdrawn (p1231 = 0) if it is not being used as a fault response in p2101.
 In order that DC braking is active as fault response, the corresponding fault number must be entered in p2100 and fault response p2101 set = 6.
 For p1231 = 5:
 DC braking is activated if the OFF1 or OFF3 command is present. Binector input p1230 is ineffective. If the drive speed still lies above the speed threshold p1234, then initially, the drive is ramped-down to this threshold, demagnetized (see p0347) and is then switched into DC braking for the time set in p1233. After this, the drive is switched-off. If, at OFF1, the drive speed is below p1234, then it is immediately demagnetized and switched into DC braking. A change is made into normal operation if the OFF1 command is withdrawn prematurely (the system waits for demagnetization). Flying restart must be activated if the motor is still rotating.
 DC braking by means of fault response continues to be possible.
 For p1231 = 14:
 In addition to the function for p1231 = 5, binector input p1230 is evaluated.
 DC braking is only automatically activated when the speed threshold p1234 is fallen below if binector input p1230 = 1 signal. This is also the case, if no OFF command is present.
 After demagnetization and after the time in p1233 has expired, the drive changes back into normal operation or is switched-off (for OFF1/OFF3).
 If a 0 signal is applied to binector input p1230, for OFF1 and OFF3 no DC braking is executed.

p1240 = 3:

When the switch-in threshold of the Vdc_min controller is reached (p1245), the following applies:

- the Vdc_min controller limits the energy taken from the DC link in order to keep the DC link voltage above the minimum DC link voltage when accelerating.
- the motor is braked in order to use its kinetic energy to buffer the DC link.
- the Vdc_min controller cannot be used when the line voltage is permanently below 380 V (if required, p1247 should be reduced).

Description:	Displays the switch-in level for the Vdc_max controller. If p1254 = 0 (automatic sensing of the switch-in level = off), then the following applies: r1242 = 1.15 * sqrt(2) * p0210 (supply voltage) PM230: r1242 is limited to Vdc_max - 50.0 V. If p1254 = 1 (automatic sensing of the switch-in level = on), then the following applies: r1242 = Vdc_max - 50.0 V (Vdc_max: Overvoltage threshold of the power unit) r1242 = Vdc_max - 25.0 V (for 230 V power units)			
Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)			
Notice:	If the activation level of the Vdc_max controller is already exceeded in the de-activated state (pulse inhibit) by the DC link voltage, then the controller can be automatically de-activated (see F07401), so that the drive is not accelerated the next time that it is activated.			
Note:	The Vdc_max controller is not switched back off until the DC-link voltage falls below the threshold 0.95 * r1242 and the controller output is zero.

Description:	Sets the lower speed threshold for the Vdc_max controller. When this speed threshold is undershot, the Vdc_max control is switched out and the speed is controlled using the ramp-function generator.		
Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)		
Note:	For fast braking where the ramp-function generator tracking was active, it is possible to prevent the drive rotating in the opposite direction by increasing the speed threshold and setting a final rounding-off time in the ramp-function generator (p1131). This is supported using a dynamic setting of the speed controller.

Description:	Sets the time threshold for the Vdc_min controller (kinetic buffering). If this value is exceeded a fault is output; the required response can be parameterized. Prerequisite: p1256 = 1		
Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1) Refer to: F07406		
Notice:	If a time threshold has been parameterized, the Vdc_max controller should also be activated (p1240 = 3) so that the drive does not shut down with overvoltage when Vdc_min control is exited (due to the time violation) and in the event of fault response OFF3. It is also possible to increase the OFF3 ramp-down time p1135.

Description:	Sets the speed threshold for the Vdc-min controller (kinetic buffering). If this value is exceeded a fault is output; the required response can be parameterized . Kinetic buffering is not started below the speed threshold.		
Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)		
Note:	Exiting the Vdc_min control before reaching motor standstill prevents the regenerative braking current from increasing significantly at low speeds, and after a pulse inhibit, means that the motor coasts down. However, the maximum braking torque can be set via the appropriate torque limiting.

Description:	Sets the configuration of the controller for the DC link voltage (Vdc controller) in the U/f operating mode.		
Value:	0: Inhib Vdc ctrl 1: Enable Vdc_max controller		
Dependency:	Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)		
Note:	For high input voltages (p0210), the following settings can improve the degree of ruggedness of the Vdc_max controller: - set the input voltage as low as possible, and in so doing, avoid A07401 (p0210). - set the rounding times (p1130, p1136). - increase the ramp-down times (p1121). - reduce the integral time of the controller (p1291), factor 0.5. - Activate the Vdc correction in the current controller (p1810.1 = 1) or reduce the derivative action time of the controller (p1292, factor 0.5). In this case, we generally recommend to use vector control (p1300 = 20) (Vdc controller, see p1240).

Description:	Sets the configuration of the controller for the DC link voltage (Vdc controller) in the U/f operating mode.		
Value:	0: Inhib Vdc ctrl 1: Enable Vdc_max controller 2: Enable Vdc_min controller (kinetic buffering) 3: Enable Vdc_min controller and Vdc_max controller		
Dependency:	Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)		
Note:	For high input voltages (p0210), the following settings can improve the degree of ruggedness of the Vdc_max controller: - set the input voltage as low as possible, and in so doing, avoid A07401 (p0210). - set the rounding times (p1130, p1136). - increase the ramp-down times (p1121). - reduce the integral time of the controller (p1291), factor 0.5. - Activate the Vdc correction in the current controller (p1810.1 = 1) or reduce the derivative action time of the controller (p1292, factor 0.5). In this case, we generally recommend to use vector control (p1300 = 20) (Vdc controller, see p1240). The following measures are suitable to improve the Vdc_min controller: - Optimize the Vdc_min controller (see p1287). - Activate the Vdc correction in the current controller (p1810.1 = 1). If a braking resistor is connected to the DC link (p0219 > 0), then the Vdc_max control is automatically de-activated.

Description:	Sets the open and closed-loop control mode of a drive.		
Value:	0: U/f control with linear characteristic 1: U/f control with linear characteristic and FCC 2: U/f control with parabolic characteristic 3: U/f control with parameterizable characteristic 4: U/f control with linear characteristic and ECO 5: U/f control for drives requiring a precise freq. (e.g. textiles) 6: U/f control for drives requiring a precise frequency and FCC 7: U/f control for a parabolic characteristic and ECO 19: U/f control with independent voltage setpoint 20: Speed control (encoderless) 22: Torque control (encoderless)		
Dependency:	Only operation with U/f characteristic is possible if the rated motor speed is not entered (p0311). Operation with a U/f characteristic is not supported for 1LE4 synchronous motors. The output voltage is used for efficiency optimization for all U/f control types, load-dependent (see p0500 = 3). Refer to: p0300, p0311, p0500, p1501		
Notice:	Active slip compensation is required in the U/f control types with Eco mode (p1300 = 4, 7). The scaling of the slip compensation (p1335) should be set so that the slip is completely compensated (generally 100%). The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed. In the case of analog setpoints, if required the tolerance for ramp-up and ramp-down should be actively increased for the ramp-function generator using p1148 in order to reliably signal a steady-state condition.		
Note:	Only by selecting closed-loop speed control (p1300 = 20) is it possible to change over in operation to closed-loop torque control (p1501). At the changeover, the setting of p1300 does not change. In this case, the actual state is displayed in r1407, bit 2 and bit 3. For the open-loop control modes p1300 = 5 and 6 (textile sector), slip compensation p1335, resonance damping p1338, and the I _{max} frequency controller are switched off internally so that the output frequency can be set precisely. The I _{max} voltage controller remains active. During operation (pulses enabled) the open-loop/closed-loop control mode cannot be changed by changing over drive data sets.

- Notice:** Active slip compensation is required in the U/f control types with Eco mode (p1300 = 4, 7). The scaling of the slip compensation (p1335) should be set so that the slip is completely compensated (generally 100%).
The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed. In the case of analog setpoints, if required the tolerance for ramp-up and ramp-down should be actively increased for the ramp-function generator using p1148 in order to reliably signal a steady-state condition.

During operation (pulses enabled) the open-loop/closed-loop control mode cannot be changed by changing over drive data sets.

Note:	For bit 03: When the bit is set, when the drive stops, the starting frequency of the motor holding brake is also not fallen below when the actual slip frequency is less than the starting frequency. For bit 04: Field orientation for the closed-loop control of the basis application. The field orientation is activated with the automatic calculation if p0096 is set = 1. For bit 05 (only effective for p1302.4 = 1): The starting current when accelerating (p1311) generally results in an increase in the absolute current and flux. With p1302.5 = 1 the current is only increased in the direction of the load. This setting is recommended for drives with higher power ratings or drives with extremely fast rates of acceleration. For bit 07: For field orientation (bit04 = 1), the I _{q,max} controller supports the current limiting controller (see p1341). For diagnostic purposes, the I _{q,max} controller can be de-activated using this bit.

2 Parameters

2.2 List of parameters

Dependency:	The starting current (voltage boost) is limited by the current limit p0640. The accuracy of the starting current depends on the setting of the stator and feeder cable resistance (p0350, p0352). For vector control, the starting current is realized using p1610. Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2) Refer to: p1300, p1311, p1312, r1315
Notice:	The starting current (voltage boost) increases the motor temperature (particularly at zero speed).
Note:	The starting current as a result of the voltage boost is only effective for U/f control (p1300). The boost values are combined with one another if the permanent voltage boost (p1310) is used in conjunction with other boost parameters (acceleration boost (p1311), voltage boost for starting (p1312)). However, these parameters are assigned the following priorities: p1310 > p1311, p1312 For field orientation (p1302.4 = 1, not PM230, PM250, PM260), p1311 and p1312 of the voltage boost is also added in the direction of the load current (non linear).

Description:	p1311 only results in a voltage boost when accelerating and generates a supplementary torque to accelerate the load. The voltage boost becomes effective for a positive setpoint increase and disappears as soon as the setpoint has been reached. The build-up and withdrawal of the voltage boost are smoothed. The magnitude of the boost in Volt at a frequency of zero is defined as follows (not for field orientation): Voltage boost [V] = 1.732 * p0305 (rated motor current [A]) x r0395 (stator/primary section resistance [ohm]) x p1311 (voltage boost when accelerating [%]) / 100 %		
Dependency:	The current limit p0640 limits the boost. For vector control, the starting current is realized using p1611. Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2) Refer to: p1300, p1310, p1312, r1315		
Notice:	The voltage boost results in a higher motor temperature increase.		
Note:	The voltage boost when accelerating can improve the response to small, positive setpoint changes. Assigning priorities for the voltage boosts: refer to p1310

	Unit group: -	Unit selection: -	Func. diagram: 6300, 6310
	Min	Max	Factory setting
	0.0 [%]	600.0 [%]	0.0 [%]
Description:	Sets the setpoint for slip compensation in [%] referred to r0330 (motor rated slip). p1335 = 0.0 %: Slip compensation de-activated. p1335 = 100.0 %: The slip is completely compensated.		
Dependency:	Prerequisite for a precise slip compensation for p1335 = 100 % are the precise motor parameters (p0350 ... p0360). If the parameters are not precisely known, a precise compensation can be achieved by varying p1335. For U/f control types with Eco optimization (4 and 7), the slip compensation must be activated in order to guarantee correct operation. Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)		
Note:	The purpose of slip compensation is to maintain a constant motor speed regardless of the applied load. The fact that the motor speed decreases with increasing load is a typical characteristic of induction motors. For synchronous motors, this effect does not occur and the parameter has no effect in this case. For the open-loop control modes p1300 = 5 and 6 (textile sector), the slip compensation is internally disabled in order to be able to precisely set the output frequency. If p1335 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1335 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

2 Parameters

2.2 List of parameters

Note: The resonance damping function dampens active current oscillations that frequency occur under no-load conditions. The resonance damping is active in a range from approximately 6 % of the rated motor frequency (p0310). The shutoff frequency is determined by p1349.
For the open-loop control modes p1300 = 5 and 6 (textile sectors), the resonance damping is internally disabled in order that the output frequency can be precisely set.

	Refer to: p1300, p1338, p1349		

p1340[0...n]	I_max frequency controller proportional gain / I_max_ctrl Kp		
Access level: 3	Calculated: p0340 = 1,3,4	Data type: FloatingPoint32	
Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180	
Unit group: -	Unit selection: -	Func. diagram: 6300	
Min	Max	Factory setting	
0.000	0.500	0.000	
Description:	Sets the proportional gain of the I_max frequency controller. The I_max controller reduces the drive converter output current if the maximum current (r0067) is exceeded. In the U/f operating modes (p1300) for the I_max control, one controller is used that acts on the output frequency and one controller that acts on the output voltage. The frequency controller reduces the current by decreasing the converter output frequency. The frequency is reduced down to a minimum value (equaling twice rated slip). If the overcurrent condition cannot be successfully resolved using this measure, then the drive converter output voltage is reduced using the I_max voltage controller. Once the overcurrent condition has been resolved, the drive is accelerated along the ramp set in p1120 (ramp-up time).		
Dependency:	In the U/f modes (p1300) for textile applications and for external voltage setpoints, only the I_max voltage controller is used. Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)		
Notice:	When de-activating the I_max controller, the following must be carefully observed: When the maximum current (r0067) is exceeded, the output current is no longer reduced. The drive is switched off when the overcurrent limits are exceeded.		
Note:	The I_max limiting controller becomes ineffective if the ramp-function generator is de-activated with p1122 = 1. p1341 = 0: I_max frequency controller de-activated and I_max voltage controller activated over the complete speed range.

Description:	Sets the integral time for the I_max frequency controller.		
Dependency:	Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2) Refer to: p1340		
Note:	When p1341 = 0, the current limiting controller influencing the frequency is de-activated and only the current limiting controller influencing the output voltage remains active (p1345, p1346). In the case of power units with regenerative feedback (PM250, PM260), current limitation control for a regenerative load is always implemented by influencing the frequency. This current limiting function is de-activated with p1340 = p1341 = 0.

0.00 [Hz]	3000.00 [Hz]	0.00 [Hz]

Description: Sets the maximum output frequency for resonance damping for U/f control.
Resonance damping is inactive above this output frequency.

Dependency: Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2)
Refer to: p1338, p1339

Note: For p1349 = 0, the changeover limit is automatically set to 95 % of the rated motor frequency - however, to a max. of 45 Hz.

Min	Max	Factory setting
0	1	0

Description: Sets whether the voltage is continuously increased during the magnetizing phase (p1350 = 1, On) or whether it jumps directly to the voltage boost (p1350 = 0, Off).

Value:
0: OFF
1: ON

Dependency: Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1), "Dynamic Drive Control" (DDC, p0096 = 2)

Note: The settings for this parameter have the following advantages and disadvantages:
0 = off (jump directly to voltage boost)
Advantage: Flux is established quickly -> torque is quickly available
Disadvantage: The motor can move while it is being magnetized
1 = on (voltage is continually established)
Advantage: The motor is unlikely to rotate
Disadvantage: The flux is established slower -> torque is available later

p1351[0...n] CO: Motor holding brake starting frequency / Brake f_start

Description: Sets the frequency setting value at the slip compensation output for starting up with motor holding brake.

Dependency: When setting p1351 > 0, then slip compensation is automatically activated (p1335 = 100 %).
Refer to: p1302, p1352

Notice: A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.

Note: Connected with p1352 a value of 100% corresponds to the motor rated slip (r0330).

Description:	Sets the signal source for the frequency setting value at the slip compensation output for starting up with motor holding brake.			
Dependency:	Not visible with application class: "Dynamic Drive Control" (DDC, p0096 = 2) Refer to: p1216			
Note:	A value of 100% corresponds to the motor rated slip (r0330). The setting of the starting frequency begins after magnetizing (see p0346, r0056.4) and ends once the brake opening time (p1216) has elapsed and the starting frequency (p1334) has been reached. A setting value of zero means that no setting procedure will take place.

	24	Accelerated moment of inertia estimator active	Yes	No	6030
	25	Acceleration torque instantaneous in the I/f mode	Yes	No	-
Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)				
Note:	For bit 01: When the bit is set, the I component of the speed controller is kept when changing into the open-loop controlled mode. For bit 16: When the bit is set, the integral component of the speed controller is only held if it reaches the torque limit. For bit 20: The acceleration model for the speed setpoint is only active for encoderless vector control if p1496 is not zero. For bit 25: When the bit is set, for high dynamic starting in the I/f mode, the acceleration precontrol torque smoothing only has a short minimum time (4 ms).				

p1401[0...n]	Flux control configuration / Flux ctrl config

	Unit group: -	Unit selection: -	Func. diagram: 6491		
	Min	Max	Factory setting		
	-	-	0000 0110 bin		
Description:	Sets the configuration for flux setpoint control				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Flux setpoint soft starting active	Yes	No	6722
	01	Flux setpoint differentiation active	Yes	No	6723
	02	Flux build-up control active	Yes	No	6722, 6723
	06	Quick magnetizing	Yes	No	6722
	07	Pre-control speed limitation	Yes	No	6640
Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)				
Note:	For bit 00 (not for permanent-magnet synchronous motors): Initially, the flux is only established with a low rate of rise when magnetizing the induction motor. The flux setpoint p1570 is reached again at the end of the magnetizing time p0346. For bit 01 (not for permanent-magnet synchronous motors): Initially, the flux is only established with a low rate of rise when magnetizing the induction motor. The flux setpoint p1570 is reached again at the end of the magnetizing time p0346. When quick magnetizing (p1401.6 = 1) is selected, soft starting is internally de-activated and alarm A07416 is displayed. The flux differentiation can be switched out if a significant ripple occurs in the field-generating current setpoint (r0075) when entering the field weakening range. However, this is not suitable for fast acceleration operations because then, the flux decays more slowly and the voltage limiting responds. For bit 02 (not for permanent-magnet synchronous motors): The flux build-up control operates during the magnetizing phase p0346 of the induction motor. If it is switched out, a constant current setpoint is injected and the flux is built up corresponding to the rotor time constant. When quick magnetizing (p1401.6 = 1) is selected and when flux build-up control is de-energized alarm A07416 is displayed.				

For bit 06 (not for induction motors):

Magnetizing is performed with maximum current ($0.9 \cdot r0067$). With active identification of the stator resistance (see p0621) quick magnetizing is internally de-activated and alarm A07416 is displayed. During a flying restart of a rotating motor (see p1200) no quick magnetizing takes place.

For bit 07:

if the speed of the drive exceeds the effective speed limit of the speed limiting controller, the torque limit is reduced linearly to zero as the deviation becomes greater. This reduces the integral component of the speed controller and, in turn, the overshoot during load shedding (see also F07901 and p2162).

Description:	Set the integral time for encoderless operation for the speed controller.

Description:	Sets the signal source for the torque setting value when starting up with motor holding brake.		
Recommendation:	To hold the actual torque when stopping the motor, you are advised to set p1400 bit 1 = 1. As a result, the integral component of the speed controller is frozen when changing to the open-loop controlled operating range.		
Dependency:	The switching in of the torque setting value for the motor holding brake has a higher priority than the setting of the integrator value using p1477 and p1478.		
	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)		
Note:	The setting of the integral output of the speed controller begins after magnetizing (see p0346, r0056 bit 4) and ends at the end of the brake control opening time p1216. A setting value of zero means that no setting procedure will take place.		
	If p1351 is used as a signal source for the torque setting value, the percentage value is interpreted in relation to the rated torque (p2003).

	Min -	Max -	Factory setting 0
Description:	Sets the signal source for the integrator setting value for the velocity controller.		
	The signal to set this integrator setting value is interconnected via p1477.		
Dependency:	The setting value of the speed controller integrator is weighted with the scaling factor of the signal source in p1479.		
	If p1478 is interconnected to the integral output of the speed controller (r1482), then after the magnetizing time (r0346) and if the speed controller is enabled, the integral component of the controller is set to the last value before the pulse inhibit. This value is set if no setting command (p1477) is interconnected or, at the instant that the pulses were inhibited, a setting command is available, which is not de-activated up to the next time that the pulses are inhibited. For sensorless vector control, in addition p1400.1 should be set to 1 so that when the drive is stopped, the integral component of the speed controller is not controlled down to zero.		
	In order that when setting the integrator output, only the static torque is detected, we recommend that the accelerating torque is completely pre-controlled (e.g. p1496).		
	If p1478 is interconnected to another output other than r1482, then after magnetizing and speed controller enable, the integral output is set once if the setting command is not interconnected (p1477 = 0).

2 Parameters

2.2 List of parameters

Caution:

For active acceleration precontrol of the speed controller (refer to p1496), it is not recommended that p1488 is set to 1, as this could result in positive coupling effects. Instead of this, as source of the droop feedback, the output signal of the speed controller should be used, which generally sets the load torque.

	Dependency: Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1) Refer to: p0341, p0342		
	Warning: The acceleration precontrol r1518 is kept at the old value if the ramp-function generator tracking (r1199.5) is active or the ramp-function generator output is set (r1199.3). This is used to avoid torque peaks. Depending on the application, it may therefore be necessary to disable the ramp-function generator tracking (p1145 = 0) or the acceleration precontrol (p1496 = 0).		
	The acceleration precontrol is set to zero, if the Vdc control is active (r0056.14/15).		
	Note: The parameter is set to 100% by the rotating measurement (refer to p1960).		
	The acceleration pre-control may not be used if the speed setpoint manifests significant ripple (e.g. analog setpoint) and the rounding-off in the speed ramp-function generator is disabled. We also recommend that the pre-control mode is not used if there is gearbox backlash.

Description: Sets the regenerative power limit.

Dependency: Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)
Refer to: r0206, p0500, p1530

Note: The power limit is limited to 300% of the rated motor power.
For power units without energy recovery capability, the regenerative power limit is preset to 30 % of the power r0206[0]. For a braking resistor connected to the DC link (p0219 > 0), the power limit when generating is automatically adapted.
For power units with energy recovery, the parameter is limited to the negative value of r0206[2].

Description:	Sets the flux threshold value for enabling the speed setpoint and the end of magnetizing (r0056.4).		
Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1), "Dynamic Drive Control" (DDC, p0096 = 2)		
Note:	The parameter only has an influence if the flux actual value reaches the threshold value p1573 more quickly during magnetizing than the time set in p0346. This is generally the case when selecting fast magnetization (p1401 bit 6). The parameter has no influence for flying restart (see p1200) and after DC braking (see p1231).

Description:	Sets the limit of the voltage target value. In steady-state field weakening operation this corresponds to the required output voltage. The value of 100% refers to p0304.		
Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)		
Note:	The output voltage is only limited if the maximum output voltage (r0071) minus the voltage reserve (p1574) corresponds to a value higher than p1575. Limiting via p1575 allows the influence of the voltage ripple of the line supply voltage to be eliminated at the operating point.

Description:	Sets the efficiency optimization. When optimizing the efficiency, the flux setpoint of the closed-loop control is adapted as a function of the load. For p1580 = 100 %, under no-load operating conditions, the flux setpoint is reduced to 50 % of the rated motor flux.		
Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)		
Note:	It only makes sense to activate this function if the dynamic response requirements of the speed controller are low. In order to avoid oscillations, if required, the speed controller parameters should be adapted (increase Tn, reduce Kp). Further, the smoothing time of the flux setpoint filter (p1582) should be increased.

Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1), "Dynamic Drive Control" (DDC, p0096 = 2)		
Note:	If the start of field weakening is shifted to lower speeds, then the voltage reserve is increased for partial load situations. If the start of field weakening is shifted to higher speeds, the voltage reserve is appropriately reduced so that for fast load changes, it can be expected that this will have a negative impact on the dynamic performance.

Description:	Sets the static torque setpoint for sensorless vector control in the low speed range. This parameter is entered as a percentage referred to the rated motor torque (r0333). For sensorless vector control, when the motor model is shut down, an absolute current is impressed. p1610 represents the maximum load that occurs at a constant setpoint speed.		
Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)		
Notice:	p1610 should always be set to at least 10 % higher than the maximum steady-state load that can occur.		
Note:	For p1610 = 0%, a current setpoint is calculated that corresponds to the no-load case (ASM: rated magnetizing current, RESM: no-load magnetizing current). For p1610 = 100 %, a current setpoint is calculated that corresponds to the rated motor torque. Negative values are converted into positive setpoints in the case of induction and permanent-magnet synchronous motors as well as closed-loop controlled reluctance motors.

Description:	Enters the dynamic torque setpoint for the low-speed range for sensorless vector control. This parameter is entered as a percentage referred to the rated motor torque (r0333).		
Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)		
Note:	When accelerating and braking p1611 is added to p1610 and the resulting total torque is converted into an appropriate current setpoint and controlled. For pure accelerating torques, it is always favorable to use the torque pre-control of the speed controller (p1496).

Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)				
Note:	For bit 17: Displays the enabled status of the rugged model feedback (p1784). The feedback is used to increase the parameter ruggedness of the motor model and is effective in the operating range of the two-component closed loop current control.				
	For bit 18: Displays the status when enabling the differential current feedback in the current model for operation with encoder. The function is automatically enabled with p1784 > 0 or p1731 > 0. The feedback is used for a rugged change between the current model and complete machine model with active rugged model feedback and combination current.				
	For bit 19: Displays the currently active stator circuit feedback in current model operation.				
	For bit 20: Displays the currently effective increase of the changeover limits by the value p1749 * p1755.				
	For bit 21: For a blocked synchronous motor, the speed ramp-function generator is held in the open-loop speed controlled operating range if the torque setpoint reaches the torque limit and the speed is less than the threshold value in p2175.

2 Parameters

2.2 List of parameters

Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1) Refer to: p1749, p1756
Notice:	The changeover speed represents the steady-state minimum speed up to which the motor model can be used in sensorless steady-state operation. If the stability is not adequate close to the changeover speed, it may make sense to increase the parameter value. On the other hand, very low changeover speeds can negatively impact the stability.
Note:	The changeover speed applies for the changeover between open-loop and closed-loop control mode.

Unit group: -	Unit selection: -	Func. diagram: 6730, 6731	
Min	Max	Factory setting	
0.0 [%]	95.0 [%]	50.0 [%]	

Description: Sets the hysteresis for the changeover speed of the motor model for encoderless operation.

Dependency: Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)
Refer to: p1755

Note: The parameter value refers to p1755.
Extremely small hystereses can have a negative impact on the stability in the changeover speed range, and very high hystereses in the standstill range.

Unit group: -	Unit selection: -	Func. diagram: -	
Min	Max	Factory setting	
100 [ms]	10000 [ms]	500 [ms]	

Description: Sets the minimum time for falling below the changeover speed when changing from closed-loop controlled operation to open-loop controlled operation.

Dependency: The wait time has no significance if the setpoint speed before the ramp-function generator lies in the open-loop speed controlled operating range. In this case, the change is made without any delay.
Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)
Refer to: p1755, p1756

Note: If p1758 is changed, commissioning must be selected in order to validate the value for the blocking monitoring.

Description: Sets the minimum time for a transition from open-loop controlled to closed-loop controlled operation after the lower changeover speed $p1755 * (1 - p1756 / 100 \%)$ has been exceeded.

Dependency: Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)
Refer to: p1755, p1756

Note: With p1759 = 2000 ms, the delay time becomes ineffective and the model changeover is determined by the output frequency only (changeover for p1755).

	13	Fast pulsed pole position identification	Yes	No	-
	14	Delay of the precontrol speed to the motor model	Yes	No	-
	15	RESM Q flux model linear active	Yes	No	-
Dependency:	In U/f characteristic operating mode only bit 7 is relevant. For active motor model feedback (see p1784), the Lh adaptation is internally de-activated automatically.				
Note:	ASM: Induction motor PMSM: permanent-magnet synchronous motor When selecting the compensation of the valve interlocking via Rs (bit 7), the compensation in the gating unit is de-activated and is instead taken into account in the motor model. In order that the correction values of the Rs, Lh and kT adaptation (selected using Bit 0 ... Bit 2) are correctly accepted when changing over the drive data set, a dedicated motor number must be entered into p0826 for each different motor. For bit 12 (only for synchronous motors and bit 6 = 1): The pole position identification is only carried out after power on and after the motor has coasted down. The switch-off speed p1226 should be as low as possible. If the power unit is switched off when the motor is stationary, then the next time that the power unit is switched on, the old angle is used as starting value. The precondition applies that while the power unit is switched off the motor does not rotate. The duration of the pole position identification is shortened using bit 13. As a consequence, the pole wheel angle error can be slightly greater.

	Unit group: -	Unit selection: -	Func. diagram: 8021
	Min	Max	Factory setting
	2.000 [kHz]	16.000 [kHz]	4.000 [kHz]
Description:	Sets the pulse frequency for the converter. This parameter is pre-set to the rated converter value when the drive is first commissioned.		
Dependency:	Refer to: p0230		
Note:	The maximum and minimum possible pulse frequency is also determined by the power unit being used (minimum pulse frequency: 2 kHz or 4 kHz). When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067). If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be set below the minimum value required for the filter. For operation with output reactors, the pulse frequency is limited to 4 kHz (see p0230). If p1800 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082).

Description:	Sets the modulator mode.		
Value:	0: Automatic changeover SVM/FLB 2: Space vector modulation (SVM) 3: SVM without overcontrol 4: SVM/FLB without overcontrol 10: SVM/FLB with modulation depth reduction 19: Optimized pulse pattern		
Dependency:	If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only space vector modulation without overcontrol can be selected as modulation type (p1802 = 3). This does not apply to power units PM260. p1802 = 10 can only be set for power units PM230 and PM240 and for r0204.15 = 0. Refer to: p0230, p0500		
Note:	When modulation modes are enabled that could lead to overmodulation (p1802 = 0, 2, 10), the modulation depth must be limited using p1803 (default, p1803 = 98%). The higher the overmodulation, the greater the current ripple and torque ripple. With p1802 = 10, the modulation depth limit is automatically reduced to 100% in the critical output frequency range (over approx. 57 Hz). When changing p1802[x], the values for all of the other existing indices are also changed.

Description:	Sets the configuration for the modulator.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Avg value filter for U_lim (only for Vdc_comp. in modulator)	Yes	No	-
	01	DC link voltage compensation in the current control	Yes	No	-
Notice:	Bit 1 = 1 can only be set under a pulse inhibit and for r0192.14 = 1.				
Note:	For bit 00 = 0: Voltage limitation from the minimum of the DC link voltage (lower ripple in the output current, reduced output voltage). For bit 00 = 1: Voltage limitation from averaged DC link voltage (higher output voltage with increased ripple in the output current). The selection is only valid if the DC link compensation is not performed in the Control Unit (bit 1 = 0). For bit 01 = 0: DC link voltage compensation in the modulator. For bit 01 = 1: DC link voltage compensation in the current control.

Description:	Sets the motor data identification and speed controller optimization. The motor identification should first be performed with the motor stationary (p1900 = 1, 2; also refer to p1910). Based on this, additional motor and control parameters can be determined using the motor data identification with the motor rotating (p1900 = 1, 3; also refer to p1960; not for p1300 < 20).			

p1900 = 0:

Function inhibited.

p1900 = 1:

Sets p1910 = 1 and p1960 = 0, 1 depending on p1300

When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next switch-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.

With the following switch-on command, a rotating motor data identification routine is carried out - and in addition, a speed controller optimization by making measurements at different motor speeds.

p1900 = 2:

Sets p1910 = 1 and p1960 = 0

When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next switch-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.

p1900 = 3:

Sets p1960 = 0, 1 depending on p1300

This setting should only be selected if the motor data identification was already carried out at standstill.

When the drive enable signals are present, with the next switch-on command, a rotating motor data identification routine is carried out - and in addition, speed controller optimization by taking measurements at different motor speeds.

Value:

- 0: Inhibited
- 1: Identifying motor data and optimizing the speed controller
- 2: Identifying motor data (at standstill)
- 3: Optimizing the speed controller (in rotating operation)

Dependency: Refer to: p1300, p1910, p1960

Notice: p1900 = 3:
This setting should only be selected if the motor data identification was already carried out at standstill.
If there is a motor holding brake, it must be open (p1215 = 2).
To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971).
During the rotating measurement it is not possible to save the parameter (p0971).
For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note: The motor and control parameters of the vector control are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating). The measurement with rotating motor is not performed for p1300 < 20 (U/f controls).

An appropriate alarm is output when the parameter is set.

The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.

The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.

p1900 is automatically set to 0 after the motor data identification routine has been completed.

If a reluctance motor has been parameterized, a pole position identification is carried out during the stationary measurement. As a consequence, faults that occur can also be assigned to the pole position identification.

2.2 List of parameters

Bit 00: Check for conductor-to-conductor short circuit once/always when the pulses are enabled.

Bit 01: Check for ground fault once/always when the pulses are enabled.

Bit 02: Activation of the tests selected using bit 00 and/or bit 01 each time the pulses are enabled

Recommendation: If the ground fault test is incorrectly initiated because the motor is not at a complete standstill, then the pulse cancellation delay time (p1228) should be increased.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Phase short-circuit test pulse active	Yes	No	-
	01	Ground fault detection test pulse active	Yes	No	-
	02	Test pulse at each pulse enable	Yes	No	-

Dependency: The ground fault test is only possible when the motor is stationary, and is therefore only realized when flying restart is de-activated (p1200 = 0).

Refer to: p0287

Note: If a conductor-to-conductor short-circuit is detected during the test, this is displayed in r1902.1.

If a ground fault is detected during the test, this is displayed in r1902.2.

For bit 02 = 0:

If the test was successful once after POWER ON (see r1902.0), it is not repeated.

For bit 02 = 1:

The test is not only performed after POWER ON, but also each time the pulses are enabled.

Note:

The following applies to permanent-magnet synchronous motors:

Without de-selection in bit 11, in the closed-loop control mode, the direct inductance LD and the quadrature inductance Lq are measured at a low current.

When de-selecting with bit 11 or in the U/f mode, the stator inductance is measured at half the rated motor current.

If the stator inductance is not measured but is to be estimated, then bit 0 should be set and bit 11 should be de-selected.

Bit 19 = 1:

All parameters are automatically saved after a successful motor data identification.

If a speed controller optimization run is then selected, the parameters are only saved after this measurement has been completed.

Bit 22 = 1:

Only that measurement is carried out that is required for the flying restart of a reluctance motor. The bit is reset after a successful measurement

Dependency:

"Quick commissioning" must be carried out (p0010 = 1, p3900 > 0) before executing the motor data identification routine!

When selecting the motor data identification routine, the drive data set changeover is suppressed.

Refer to: p1900

Refer to: F07990, A07991

2 Parameters

2.2 List of parameters

- Notice:** After the motor data identification (p1910 > 0) has been selected, alarm A07991 is output and a motor data identification routine is carried out as follows at the next switch-on command:
- current flows through the motor and a voltage is present at the drive converter output terminals.
 - during the identification routine, the motor shaft can rotate through a maximum of half a revolution.
 - however, no torque is generated.
- Note:** If there is a motor holding brake, it must be open (p1215 = 2).
To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971).
When setting p1910, the following should be observed:
1. "With acceptance" means:
The parameters specified in the description are overwritten with the identified values and therefore have an influence on the controller setting.
 2. "Without acceptance" means:
The identified parameters are only displayed in the range r1912 ... r1926 (service parameters). The controller settings remain unchanged.
 3. For settings 27 and 28, the AVC configuration set using p1840 is active.
The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it. The duration of the measurements can lie between 0.3 s and several minutes. This time is mainly influenced by the motor size. At the end of the motor data identification, p1910 is automatically set to 0, if only the stationary measurement is selected, then p1900 is also reset to 0, otherwise, the rotating measurement is activated.

Description: Sets the rotating measurement.

The rotating measurement is carried out after the next switch-on command.

The setting possibilities of the parameter depend on the open-loop/closed-loop control mode (p1300).

p1300 < 20 (U/f open-loop control):

It is not possible to select rotating measurement or speed controller optimization.

2 Parameters

2.2 List of parameters

p1300 = 20, 22 (encoderless operation):

Only rotating measurement or speed controller optimization can be selected in the encoderless mode.

Value:
0: Inhibited
1: Rotating measurement in encoderless operation
3: Speed controller optimization in encoderless operation

Dependency: Before the rotating measurement is carried out, the motor data identification routine (p1900, p1910, r3925) should have already been done.

When selecting the rotating measurement, the drive data set changeover is suppressed.

Refer to: p1300, p1900, p1959, p1967, r1968

Danger:

For drives with a mechanical system that limits the distance moved, it must be ensured that this is not reached during the rotating measurement. If this is not the case, then it is not permissible that the measurement is carried out.

Notice: If there is a motor holding brake, it must be open (p1215 = 2).

To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971).

During the rotating measurement it is not possible to save the parameter (p0971).

Note: When the rotating measurement is activated, it is not possible to save the parameters (p0971).

Parameter changes are automatically made for the rotating measurement (e.g. p1120); this is the reason that up to the end of the measurement, and if no faults are present, no manual changes should be made.

The ramp-up and ramp-down times (p1120, p1121) are limited, for the rotating measurement, to 900 s.

Can be changed: U, T	Scaling: -	Dyn. index: -
Unit group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
10 [%]	75 [%]	40 [%]

Description: Sets the speed for the identification of the moment of inertia and the vibration test.

Induction motor:

The percentage value is referred to p0310 (rated motor frequency).

Synchronous motor:

The percentage value is referred to the minimum from p0310 (rated motor frequency) and p1082 (maximum speed).

Dependency: Refer to: p0310, p1959

Refer to: F07984, F07985

Note: In order to calculate the inertia, sudden speed changes are carried out - the specified value corresponds to the lower speed setpoint. This value is increased by 20 % for the upper speed value.

The q leakage inductance (refer to p1959.5) is determined at zero speed and at 50 % of p1965 - however, with a maximum output frequency of 15 Hz and at a minimum of 10% of the rated motor speed.

	1 [%]	400 [%]	100 [%]
Description:	Sets the dynamic response factor for speed controller optimization. After optimization, the dynamic response achieved is displayed in r1968.		
Dependency:	Refer to: p1959, r1968 Refer to: F07985		
Note:	For a rotating measurement, this parameter can be used to optimize the speed controller. p1967 = 100 % --> speed controller optimization according to a symmetric optimum. p1967 > 100 % --> optimization with a higher dynamic response (Kp higher, Tn lower). If the actual dynamic response (see r1968) is significantly reduced with respect to the required dynamic response (p1967), then this can be as a result of mechanical load oscillations. If, in spite of this load behavior, a higher dynamic response is required, then the oscillation test (p1959.4 = 0) should be de-activated and the measurement repeated.

Description: Displays the trigger characteristic of the pole position identification routine.
The values for the characteristic of the last pole position identification routine are output every 1 ms in order to record signals (e.g. trace).

The values for trigger characteristic and saturation characteristic are always output in synchronism from a time perspective.

Dependency: Refer to: p0325, p0329, p1980, r1984, r1985

Note: PolID: Pole position identification

The following information and data can be taken from the trigger characteristic.

- the value -100% marks the angle at the start of the measurement.

- the value +100 % marks the commutation angle determined from the pole position identification routine.

Description: Sets the scaling for the runtime of the pole position identification technique in which the current is injected.

Dependency: Refer to: p0341, p0342

Caution: For p1999 > 100 % (setting large moments of inertia) the following applies:

 There is no locked rotor monitoring (F07970 fault value 2).

Note: For high moments of inertia, it is practical to scale the runtime of the calibration higher.

6.00 [rpm]	210000.00 [rpm]	1500.00 [rpm]

Description: Sets the reference quantity for speed and frequency.

All speeds or frequencies specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

The following applies: Reference frequency (in Hz) = reference speed (in ((rpm) / 60) x pole pair number)

Dependency: This parameter is only updated during the automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning was carried out beforehand for drive data set zero. This means that the parameter is not locked against overwriting using p0573 = 1.

Refer to: p2001, p2002, p2003, r2004, r3996

Notice: When the reference speed / reference frequency is changed, short-term communication interruptions may occur.

Note: If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

Example 1:

The signal of an analog input (e.g. r0755[0]) is connected to a speed setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute speed setpoint using the reference speed (p2000).

Example 2:

The setpoint from PROFIBUS (r2050[1]) is connected to a speed setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute speed setpoint via reference speed (p2000).

	10 [Vrms]	100000 [Vrms]	1000 [Vrms]
Description:	<p>Sets the reference quantity for voltages.</p> <p>All voltages specified as relative value are referred to this reference quantity. This also applies for direct voltage values (= rms value) like the DC-link voltage.</p> <p>The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).</p> <p>Note:</p> <p>This reference quantity also applies to direct voltage values. It is not interpreted as rms value, but as DC voltage value.</p>		
Dependency:	<p>p2001 is only updated during automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning has been carried out first for drive data set zero and as a result overwriting of the parameter has not been blocked by setting p0573 = 1.</p> <p>Refer to: r3996</p>		
Notice:	<p>When the reference voltage is changed, short-term communication interruptions may occur.</p>		
Note:	<p>If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.</p> <p>For infeed units, the parameterized device supply voltage (p0210) is pre-assigned as the reference quantity.</p> <p>Example:</p> <p>The actual value of the DC link voltage (r0070) is connected to a test socket (e.g. p0771[0]). The actual voltage value is cyclically converted into a percentage of the reference voltage (p2001) and output according to the parameterized scaling.</p>		
p2002	Reference current / I_ref		
	Access level: 3	Calculated: p0340 = 1	Data type: FloatingPoint32

	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0.10 [Arms]	100000.00 [Arms]	100.00 [Arms]
Description:	<p>Sets the reference quantity for currents.</p> <p>All currents specified as relative value are referred to this reference quantity.</p> <p>The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).</p>		
Dependency:	<p>This parameter is only updated during the automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning was carried out beforehand for drive data set zero. This means that the parameter is not locked against overwriting using p0573 = 1.</p> <p>Refer to: r3996</p>		
Notice:	<p>If various DDS are used with different motor data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor must be taken into account.</p> <p>Example:</p> <p>p2002 = 100 A</p> <p>Reference quantity 100 A corresponds to 100 %</p> <p>p0305[0] = 100 A</p> <p>Rated motor current 100 A for MDS0 in DDS0 --> 100 % corresponds to 100 % of the rated motor current</p> <p>p0305[1] = 50 A</p> <p>Rated motor current 50 A for MDS1 in DDS1 --> 100 % corresponds to 200 % of the rated motor current</p> <p>When the reference current is changed, short-term communication interruptions may occur.</p>		

Note: Pre-assigned value is p0640.
 If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
 For infeed units, the rated line current, which is obtained from the rated power and parameterized rated line supply voltage ($p2002 = r0206 / p0210 / 1.73$) is pre-assigned as the reference quantity.
 Example:
 The actual value of a phase current (r0069[0]) is connected to a test socket (e.g. p0771[0]). The actual current value is cyclically converted into a percentage of the reference current (p2002) and output according to the parameterized scaling.

Description:	Sets the reference quantity for torque. All torques specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
Dependency:	This parameter is only updated during the automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning was carried out beforehand for drive data set zero. This means that the parameter is not locked against overwriting using p0573 = 1. Refer to: r3996		
Notice:	When the reference torque is changed, short-term communication interruptions may occur.		
Note:	Pre-assigned value is $2 * p0333$. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. Example: The actual value of the total torque (r0079) is connected to a test socket (e.g. p0771[0]). The actual torque is cyclically converted into a percentage of the reference torque (p2003) and output according to the parameterized scaling.

13: 187500 baud

Notice:

For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

For p0014 = 0, the following applies:

Before a changed setting becomes permanently effective, a non-volatile RAM to ROM data save is required. To do this, set p0971 = 1 or p0014 = 1.

Note:

Fieldbus IF: Fieldbus interface

Changes only become effective after POWER ON.

The parameter is not influenced by setting the factory setting.

The parameter is set to the factory setting when the protocol is reselected.

When p2030 = 1 (USS), the following applies:

Description:

Displays or sets the address for the fieldbus interface (RS485).

The address can be set as follows:

1) Using the address switch on the Control Unit.

--> p2021 displays the address setting.

--> A change only becomes effective after a POWER ON.

2) Using p2021

--> Only if an address of 0 or an address that is invalid for the fieldbus selected in p2030 has been set using the address switch.

--> The address is saved in a non-volatile fashion using the function "copy from RAM to ROM".

--> A change only becomes effective after a POWER ON.

Dependency:

Notice:

For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

For p0014 = 0, the following applies:

Before a changed setting becomes permanently effective, a non-volatile RAM to ROM data save is required. To do this, set p0971 = 1 or p0014 = 1.

Note:

Changes only become effective after POWER ON.

The parameter is not influenced by setting the factory setting.

The parameter is set to the factory setting when the protocol is reselected.

When p2030 = 1 (USS), the following applies:

	Min	Max	Factory setting
	0 [ms]	10000 [ms]	[0] 1000 [ms] [1] 0 [ms] [2] 0 [ms]
Description:	Sets the time values for the fieldbus interface. For Modbus the following applies: p2024[0, 1]: Not relevant. p2024[2]: Telegram pause time (pause time between two telegrams).		
Index:	[0] = Max. processing time [1] = Character delay time [2] = Telegram pause time		
Dependency:	Refer to: p2020, p2030		
Note:	For p2024[2] (Modbus): If the field bus baud rate is changed (p2020), the default time setting is restored. The default setting corresponds to a time of 3.5 characters (dependent on the baud rate that has been set).

Description:	Displays the receive errors on the field bus interface (RS485).		

2 Parameters

2.2 List of parameters

Index:

- [0] = Number of error-free telegrams
- [1] = Number of rejected telegrams
- [2] = Number of framing errors
- [3] = Number of overrun errors
- [4] = Number of parity errors
- [5] = Number of starting character errors
- [6] = Number of checksum errors
- [7] = Number of length errors

p2030 Field bus int protocol selection / Field bus protocol

CU240B-2_DP	Access level: 1	Calculated: -	Data type: Integer16
CU240E-2_DP	Can be changed: T	Scaling: -	Dyn. index: -
CU240E-2_DP_F	Unit group: -	Unit selection: -	Func. diagram: 9310
	Min	Max	Factory setting
	0	3	3

Description: Sets the communication protocol for the field bus interface.

Value:

- 0: No protocol
- 3: PROFIBUS

Notice: For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note: Changes only become effective after POWER ON.

The parameter is not influenced by setting the factory setting.

p2030 Field bus int protocol selection / Field bus protocol

CU240B-2	Access level: 1	Calculated: -	Data type: Integer16
CU240E-2	Can be changed: T	Scaling: -	Dyn. index: -
CU240E-2_F	Unit group: -	Unit selection: -	Func. diagram: 9310
	Min	Max	Factory setting
	0	2	0

Description: Sets the communication protocol for the field bus interface.

Value:

- 0: No protocol
- 1: USS
- 2: Modbus RTU

Notice: For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note: Changes only become effective after POWER ON.

The parameter is not influenced by setting the factory setting.

p2030 Field bus int protocol selection / Field bus protocol

CU240E-2 PN	Access level: 1	Calculated: -	Data type: Integer16
CU240E-2_PN_F	Can be changed: T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: 9310
	Min	Max	Factory setting
	0	10	7

Description: Sets the communication protocol for the field bus interface.

Value:

- 0: No protocol
- 7: PROFINET
- 10: EtherNet/IP

Notice: For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note: Changes only become effective after POWER ON.

The parameter is not influenced by setting the factory setting.

p2031 Fieldbus interface MODBUS parity / Modbus parity

CU240B-2	Access level: 2	Calculated: -	Data type: Integer16
CU240E-2	Can be changed: T	Scaling: -	Dyn. index: -
CU240E-2_F	Unit group: -	Unit selection: -	Func. diagram: 9310
	Min	Max	Factory setting
	0	2	2

Description: Sets the parity for the Modbus protocol (p2030 = 2).

Value: 0: No parity
1: Odd parity
2: Even parity

Note: Fieldbus IF: Fieldbus interface
Changes only become effective after POWER ON.
The parameter is not influenced by setting the factory setting.
The parameter is set to the factory setting when the protocol is reselected (p2030 = 2).

r2032 Master control control word effective / PcCtrl STW eff

Access level: 3	Calculated: -	Data type: Unsigned16
Can be changed: -	Scaling: -	Dyn. index: -
Unit group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
-	-	-

Description: Displays the effective control word 1 (STW1) of the drive for the master control.

Bit	Signal name	1 signal	0 signal	FP
00	ON/OFF1	Yes	No	-
01	OC / OFF2	Yes	No	-
02	OC / OFF3	Yes	No	-
03	Operation enable	Yes	No	-

05	Start ramp-function generator	Yes	No	-
06	Speed setpoint enable	Yes	No	-
07	Acknowledge fault	Yes	No	-
08	Jog bit 0	Yes	No	3030
09	Jog bit 1	Yes	No	3030
10	Master control by PLC	Yes	No	-

Notice: The master control only influences control word 1 and speed setpoint 1. Other control word/setpoints can be transferred from another automation device.

Note: OC: Operating condition

p2037 PROFIdrive STW1.10 = 0 mode / PD STW1.10=0

CU240B-2_DP	Access level: 3	Calculated: -	Data type: Integer16
CU240E-2_DP	Can be changed: T	Scaling: -	Dyn. index: -
CU240E-2 PN	Unit group: -	Unit selection: -	Func. diagram: -
CU240E-2_PN_F	Min	Max	Factory setting
CU240E-2_DP_F	0	2	0

Description: Sets the processing mode for PROFIdrive STW1.10 "master control by PLC".

Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.

Value: 0: Freeze setpoints and continue to process sign-of-life
1: Freeze setpoints and sign-of-life
2: Do not freeze setpoints

Recommendation: Do not change the setting p2037 = 0.

Note: If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

p2038	PROFIdrive STW/ZSW interface mode / PD STW/ZSW IF mode		
CU240B-2_DP	Access level: 3	Calculated: -	Data type: Integer16
CU240E-2_DP	Can be changed: T	Scaling: -	Dyn. index: -
CU240E-2 PN	Unit group: -	Unit selection: -	Func. diagram: -
CU240E-2_PN_F	Min	Max	Factory setting
CU240E-2_DP_F	0	2	0
Description:	Sets the interface mode of the PROFIdrive control words and status words. When selecting a telegram via p0922 (p2079), this parameter influences the device-specific assignment of the bits in the control and status words.		
Value:	0: SINAMICS 2: VIK-NAMUR		
Dependency:	Refer to: p0922, p2079		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	- For p0922 (p2079) = 1, 350 ... 999, p2038 is automatically set to 0. - For p0922 (p2079) = 20, p2038 is automatically set to 2. It is not then possible to change p2038.		
p2039	Select debug monitor interface / Debug monit select

	Can be changed: U, T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	3	0
Description:	The serial interface for the debug monitor is COM1 (commissioning interface, RS232) or COM2 (fieldbus interface, RS485). Value = 0: De-activated Value = 1: COM1, commissioning protocol is de-activated Value = 2: COM2, field bus is de-activated Value = 3: Reserved		
Note:	Value = 2 is only possible for Control Units with RS485 as a field bus interface.		
p2040	Fieldbus interface monitoring time / Fieldbus t_monit		
CU240B-2	Access level: 3	Calculated: -	Data type: FloatingPoint32
CU240E-2	Can be changed: U, T	Scaling: -	Dyn. index: -

	Min	Max	Factory setting
	0 [ms]	1999999 [ms]	100 [ms]
Description:	Sets the monitoring time to monitor the process data received via the fieldbus interface. If no process data is received within this time, then an appropriate message is output.		
Dependency:	Refer to: F01910		
Note:	p2040 = 0: Monitoring is de-activated.		
p2042	PROFIBUS Ident Number / PB Ident No.		
CU240B-2_DP	Access level: 3	Calculated: -	Data type: Integer16
CU240E-2_DP	Can be changed: T	Scaling: -	Dyn. index: -
CU240E-2_DP_F	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	1	0
Description:	Sets the PROFIBUS Ident Number (PNO-ID). SINAMICS can be operated with various identities on PROFIBUS. This allows the use of a PROFIBUS GSD that is independent of the device (e.g. PROFIdrive VIK-NAMUR with Ident Number 3AA0 hex).		

Value: 0: SINAMICS
1: VIK-NAMUR

Notice: For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note: Every change only becomes effective after a POWER ON.

r2043.0...2 BO: PROFIdrive PZD state / PD PZD state

CU240E-2_PN_F	Min	Max	Factory setting
CU240E-2_DP_F	-	-	-

Description: Displays the PROFIdrive PZD state.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Setpoint failure	Yes	No	-
	02	Fieldbus oper	Yes	No	-

Dependency: Refer to: p2044

Note: When using the "setpoint failure" signal, the bus can be monitored and an application-specific response triggered when the setpoint fails.

p2044 PROFIdrive fault delay / PD fault delay

CU240B-2_DP	Access level: 3	Calculated: -	Data type: FloatingPoint32

CU240E-2_PN_F	Min	Max	Factory setting
CU240E-2_DP_F	0 [s]	100 [s]	0 [s]

Description: Sets the delay time to initiate fault F01910 after a setpoint failure.

The time until the fault is initiated can be used by the application. This means that it is possible to respond to the failure while the drive is still operational (e.g. emergency retraction).

Dependency: Refer to: r2043
Refer to: F01910

p2047 PROFIBUS additional monitoring time / PB suppl t_monit

CU240E-2_DP_F	Unit group: -	Unit selection: -	Func. diagram: 2410
	Min	Max	Factory setting
	0 [ms]	20000 [ms]	0 [ms]

Description: Sets the additional monitoring time to monitor the process data received via PROFIBUS.

Enables short bus faults to be compensated.

If no process data is received within this time, then an appropriate message is output.

Dependency: Refer to: F01910

Note: For controller STOP, the additional monitoring time is not effective.

Dependency: Refer to: p0922

Note: For p0922 < 999 the following applies:
p2079 has the same value and is inhibited. All of the interconnections and extensions contained in the telegram are inhibited.
For p0922 = 999 the following applies:
p2079 can be freely set. If p2079 is also set to 999, then all of the interconnections can be set.
For p0922 = 999 and p2079 < 999 the following applies:
The interconnections contained in the telegram are inhibited. However, the telegram can be extended.

Description:	Sets the fault response for the selected fault.		
Value:	0: NONE 1: OFF1 2: OFF2 3: OFF3 5: STOP2 6: Internal armature short-circuit / DC braking		
Dependency:	The fault is selected and the required response is set under the same index.		
	Refer to: p2100		
Notice:	For the following cases, it is not possible to re-parameterize the fault response to a fault: - fault number does not exist (exception value = 0). - Message type is not "fault" (F). - fault response is not permissible for the set fault number.		
Note:	Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved. The fault response can only be changed for faults with the appropriate identification. Example: F12345 and fault response = NONE (OFF1, OFF2) --> The fault response NONE can be changed to OFF1 or OFF2. For value = 1 (OFF1): Braking along the ramp-function generator down ramp followed by a pulse inhibit.		

2 Parameters

2.2 List of parameters

For value = 2 (OFF2):

Internal/external pulse inhibit.

For value = 3 (OFF3):

Braking along the OFF3 down ramp followed by a pulse inhibit.

For value = 5 (STOP2):

n_set = 0

For value = 6 (armature short-circuit, internal/DC braking):

This value can only be set for all drive data sets when p1231 = 4.

a) DC braking is not possible for synchronous motors.

b) DC braking is possible for induction motors.

Description:	Sets the message type for the selected fault or alarm.		
Value:	1: Fault (F) 2: Alarm (A) 3: No message (N)		
Dependency:	Selects the fault or alarm selection and sets the required type of message realized under the same index. Refer to: p2118		

2 Parameters

2.2 List of parameters

Note: Re-parameterization is also possible if a message is present. The change only becomes effective after the message has gone.
The message type can only be changed for messages with the appropriate identification (exception, value = 0).
Example:
F12345(A) --> Fault F12345 can be changed to alarm A12345.
In this case, the message number that may be possibly entered in p2100[0...19] and p2126[0...19] is automatically removed.

-	-	-	

Description: This counter is incremented every time the alarm buffer changes.

Dependency: Refer to: r2110, r2122, r2123, r2124, r2125

r2122[0...63]	Alarm code / Alarm code		
Access level: 2	Calculated: -	Data type: Unsigned16	
Can be changed: -	Scaling: -	Dyn. index: -	
Unit group: -	Unit selection: -	Func. diagram: 8050, 8065	
Min	Max	Factory setting	
-	-	-	

Description: Displays the number of alarms that have occurred.

Dependency: Refer to: r2110, r2123, r2124, r2125, r2134, r2145, r2146, r3121, r3123

Notice: The properties of the alarm buffer should be taken from the corresponding product documentation.

Note: The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

Alarm buffer structure (general principle):

r2122[0], r2124[0], r2123[0], r2125[0] --> alarm 1 (the oldest)

...

r2122[7], r2124[7], r2123[7], r2125[7] --> Alarm 8 (the latest)

When the alarm buffer is full, the alarms that have gone are entered into the alarm history:

r2122[8], r2124[8], r2123[8], r2125[8] --> Alarm 1 (the latest)

...

r2122[63], r2124[63], r2123[63], r2125[63] --> alarm 56 (the oldest)

r2123[0...63]	Alarm time received in milliseconds / t_alarm recv ms

Description: Displays the system runtime in milliseconds when the alarm occurred.

Dependency: Refer to: r2110, r2122, r2124, r2125, r2134, r2145, r2146

Notice: The time comprises r2145 (days) and r2123 (milliseconds).

Note: The buffer parameters are cyclically updated in the background (refer to status signal in r2139).
The structure of the alarm buffer and the assignment of the indices is shown in r2122.

r2124[0...63]	Alarm value / Alarm value		
	Access level: 3	Calculated: -	Data type: Integer32

	-	-	-

Description: Displays additional information about the active alarm (as integer number).

Dependency: Refer to: r2110, r2122, r2123, r2125, r2134, r2145, r2146, r3121, r3123

Note: The buffer parameters are cyclically updated in the background (refer to status signal in r2139).
The structure of the alarm buffer and the assignment of the indices is shown in r2122.

r2125[0...63]	Alarm time removed in milliseconds / t_alarm res ms		
	Access level: 3	Calculated: -	Data type: Unsigned32

	Unit group: -	Unit selection: -	Func. diagram: 8050, 8065
	Min	Max	Factory setting
	- [ms]	- [ms]	- [ms]

Description: Displays the system runtime in milliseconds when the alarm was cleared.

Dependency: Refer to: r2110, r2122, r2123, r2124, r2134, r2145, r2146

Notice: The time comprises r2146 (days) and r2125 (milliseconds).

Note: The buffer parameters are cyclically updated in the background (refer to status signal in r2139).
The structure of the alarm buffer and the assignment of the indices is shown in r2122.

Description: Sets the acknowledge mode for selected fault.

Value: 1: Acknowledgment only using POWER ON
2: Ack IMMEDIATELY after the fault cause has been removed

Dependency: Selects the faults and sets the required acknowledge mode realized under the same index
Refer to: p2126

Notice: It is not possible to re-parameterize the acknowledge mode for a fault in the following cases:
- fault number does not exist (exception value = 0).
- Message type is not "fault" (F).
- Acknowledge mode is not permissible for the set fault number.

2 Parameters

2.2 List of parameters

Note: Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.
The acknowledge mode can only be changed for faults with the appropriate identification.
Example:
F12345 and acknowledge mode = IMMEDIATELY (POWER ON)
--> The acknowledge mode can be changed from IMMEDIATELY to POWER ON.

Note:	For bit 03, 07: These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. This is the reason that the fault/alarm buffer should only be read if, after "fault present" or "alarm present" has occurred, a change in the buffer was also detected (r0944, r9744, r2121). For bit 06, 08: These status bits are used for internal diagnostic purposes only. For bit 11, 12: These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

Description:	Sets the hysteresis speed (bandwidth) for the signal "n_act > n_max" (BO: r2197.6).		
Dependency:	Refer to: r1084, r1087, r2197		
Notice:	For p0322 = 0, the following applies: p2162 ≤ 0.1 * p0311 For p0322 > 0, the following applies: p2162 ≤ 1.02 * p0322 - p1082 If one of the conditions is violated, p2162 is appropriately and automatically reduced when exiting the commissioning mode.		
Note:	For a negative speed limit (r1087) the hysteresis is effective below the limit value and for a positive speed limit (r1084) above the limit value. If significant overshoot occurs in the maximum speed range (e.g. due to load shedding), you are advised to increase the dynamic response of the speed controller (if possible). If this is insufficient, the hysteresis p2162 can only be increased by more than 10% of the rated speed when the maximum speed (p0322) of the motor is sufficiently greater than the speed limit p1082.

p2165[0...n]	Load monitoring stall monitoring upper threshold / Stall_mon up thr		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180
	Unit group: 3_1	Unit selection: p0505	Func. diagram: 8013
	Min 0.00 [rpm]	Max 210000.00 [rpm]	Factory setting 0.00 [rpm]
Description:	Sets the upper speed threshold of the stall monitoring of the pump or fan. The lower limit is formed by the speed threshold 1 of the load monitoring (p2182). The stall monitoring is active between p2182 and p2165.		
Dependency:	The following applies: p2182 < p2165 Refer to: p2181, p2182, p2193 Refer to: A07891, F07894, A07926		
Note:	For p2165 = 0 or p2165 < p2182, the following applies: There is no special stall monitoring for the pump/fan, but only the remaining load monitoring functions (e.g. leakage monitoring for a pump) for the pump or fan are active.		
p2166[0...n]	Off delay n_act = n_set / t_del_off n_i=n_so		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180
	Unit group: -	Unit selection: -	Func. diagram: 8011
	Min 0.0 [ms]	Max 10000.0 [ms]	Factory setting 200.0 [ms]
Description:	Sets the switch-off delay time for the "speed setpoint - actual value deviation in tolerance t_off" signal/message (BO: r2197.7).		
Dependency:	Refer to: p2163, p2164, r2197		
p2167[0...n]	Switch-on delay n_act = n_set / t_on n_act=n_set		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180
	Unit group: -	Unit selection: -	Func. diagram: 8011
	Min 0.0 [ms]	Max 10000.0 [ms]	Factory setting 200.0 [ms]
Description:	Sets the switch-on delay for the "speed setpoint - actual value deviation in tolerance t_on" signal/message (BO: r2199.4).		

p2168[0...n]	Load monitoring stall monitoring torque threshold / Stall_mon M_thresh		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180
	Unit group: 7_1	Unit selection: p0505	Func. diagram: 8013
	Min	Max	Factory setting
	0.00 [Nm]	20000000.00 [Nm]	10000000.00 [Nm]
Description:	Sets the torque threshold of the stall monitoring of the pump or fan. If, in the monitored speed range from p2182 to p2165, the torque exceeds this threshold, then this is evaluated as either the motor having stalled or heavy-duty starting.		
Dependency:	For pumps, the following applies (p2193 = 4): - the leakage characteristic must lie below the torque threshold for the stall monitoring - the torque threshold for dry running operation must lie below the torque threshold for stall monitoring For fans, the following applies (p2193 = 5): - the torque threshold for the stall monitoring must lie above the torque threshold to identify belt breakage (p2191). Refer to: p2165, p2181, p2191, p2193 Refer to: A07891, F07894, A07926		
Note:	The following applies for p2168 = 0: The special stall monitoring for pump/fan is de-activated. Then, only the remaining load monitoring functions (e.g. the leakage monitoring for a pump) for pump or fan are realized.		
r2169	CO: Actual speed smoothed signals / n_act smth message

	Unit group: -	Unit selection: -	Func. diagram: -
	Min 0 [ms]	Max 10000 [ms]	Factory setting 10 [ms]
Description:	Sets the delay time for the comparison of the DC link voltage r0070 with the threshold value p2172.		
Dependency:	Refer to: p2172		
p2174[0...n]	Torque threshold value 1 / M_thresh val 1		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180
	Unit group: 7_1	Unit selection: p0505	Func. diagram: 8012
	Min 0.00 [Nm]	Max 20000000.00 [Nm]	Factory setting 5.13 [Nm]
Description:	Sets the torque threshold value for the messages: "Torque setpoint < torque threshold value 1 and n_set reached" (BO: r2198.9) "Torque setpoint < torque threshold value 1" (BO: r2198.10) "Torque setpoint > torque threshold value 1" (BO: r2198.13)		
Dependency:	Refer to: p2195, r2198		
p2175[0...n]	Motor blocked speed threshold / Mot lock n_thresh		
	Access level: 3	Calculated: p0340 = 1,3,5	Data type: FloatingPoint32
	Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180
	Unit group: 3_1	Unit selection: p0505	Func. diagram: 8012
	Min 0.00 [rpm]	Max 210000.00 [rpm]	Factory setting 120.00 [rpm]
Description:	Sets the speed threshold for the message "Motor blocked" (BO: r2198.6).		
Dependency:	Refer to: p0500, p2177, r2198 Refer to: F07900		
Note:	The following applies for encoderless vector control for induction motors: At low speeds in open-loop speed controlled operation (see p1755, p1756), a blocked motor cannot be detected. The following applies for encoderless vector control for permanent magnet synchronous motors: At low speeds in open-loop speed controlled operation (see p1755, p1756), a blocked motor can only be detected if p2175 = p1755, and p1750.6 is set to 1.		

p2176[0...n]	Torque threshold value comparison delay time / M_thrsh comp T_del

	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0 [ms]	10000 [ms]	200 [ms]
Description:	Sets the delay time for the comparison of the torque actual value (r0080) with torque threshold value 1 (p2174).		
Dependency:	Refer to: p2174		
p2177[0...n]	Motor blocked delay time / Mot lock t_del		
	Access level: 3	Calculated: p0340 = 1,3,5	Data type: FloatingPoint32
	Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180
	Unit group: -	Unit selection: -	Func. diagram: 8012
	Min	Max	Factory setting
	0.000 [s]	65.000 [s]	3.000 [s]
Description:	Sets the delay time for the message "Motor blocked" (BO: r2198.6).		
Dependency:	Refer to: p0500, p2175, r2198 Refer to: F07900		
Note:	The following applies for sensorless vector control: At low speeds a locked motor can only be detected if no change is made to open-loop speed controlled operation. If this is the case, the value in p2177 must be reduced accordingly (p2177 < p1758) before time p2177 has elapsed in order to detect the locked state reliably. As countermeasure, it is generally also possible to set p1750.6. This is only not permitted if the drive is slowly reversed by the load at the torque limit (speed below p1755 for longer than p1758).		
p2178[0...n]	Motor stalled delay time / Mot stall t_del		
	Access level: 3	Calculated: p0340 = 1,3	Data type: FloatingPoint32
	Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180
	Unit group: -	Unit selection: -	Func. diagram: 8012
	Min	Max	Factory setting
	0.000 [s]	10.000 [s]	0.010 [s]
Description:	Sets the delay time for the message "Motor stalled" (BO: r2198.7).		
Dependency:	Refer to: r2198		
Note:	In the open-loop speed controlled operating range (see p1755, p1756), vector control stall monitoring depends on threshold p1745. At higher speeds, the difference between flux setpoint r0083 and flux actual value r0084 is monitored.		
p2179[0...n]	Output load identification current limit / Outp_Id iden I_lim		
	Access level: 3	Calculated: p0340 = 1,3,5	Data type: FloatingPoint32
	Can be changed: U, T	Scaling: p2002	Dyn. index: DDS, p0180
	Unit group: 6_2	Unit selection: p0505	Func. diagram: 8022
	Min	Max	Factory setting
	0.00 [Arms]	1000.00 [Arms]	0.00 [Arms]
Description:	Sets the current limit for output load identification. A missing output load is displayed using the "Output load not available" message (r2197.11 = 1). This message is output with a delay time (p2180).		
Dependency:	Refer to: p2180		
Notice:	For synchronous motors the output current can be almost zero under no load conditions.		
Note:	Missing output load is signaled in the following cases: - the motor is not connected. - a phase failure has occurred.		

p2180[0...n]	Output load detection delay time / Out_load det t_del		
	Access level: 3	Calculated: -	Data type: Unsigned16

	Min	Max	Factory setting
	0.00 [rpm]	210000.00 [rpm]	150.00 [rpm]
Description:	Sets the speed/torque envelope curve for load monitoring. The envelope curve (upper and lower envelope curve) is defined as follows based on 3 speed thresholds: p2182 (n_threshold 1) --> p2185 (M_threshold 1, upper), p2186 (M_threshold 1, lower) p2183 (n_threshold 2) --> p2187 (M_threshold 2, upper), p2188 (M_threshold 2, lower) p2184 (n_threshold 3) --> p2189 (M_threshold 3, upper), p2190 (M_threshold 3, lower)		
Dependency:	The following applies: p2182 < p2183 < p2184 Refer to: p2183, p2184, p2185, p2186 Refer to: A07926		
Note:	In order that the load monitoring can reliably respond, the speed threshold p2182 should always be set lower than the minimum motor speed to be monitored.

04	Speed setp - act val deviation in tolerance t_on	Yes	No	8011
05	Ramp-up/ramp-down completed	Yes	No	8011
11	Torque utilization < torque threshold value 2	Yes	No	8012

Note:

For bit 00:

The speed threshold value 3 is set in p2161.

For bit 01:

The comparison value is set in p2141. We recommend setting the hysteresis (p2142) for canceling the bit to a value lower than that in p2141. Otherwise, the bit is not reset.

For bit 11:

The torque threshold value 2 is set in p2194.

Dependency:	Refer to: r2231, p2240			
Notice:	For p0014 = 1, the following applies: After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.			
Note:	For bit 00: 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240. 1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1. For bit 02: 0: Without initial rounding-off 1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237). It is calculated as follows: $r = 0.0001 \times \max(p2237, p2238) [\%] / 0.13^2 [s^2]$ The jerk is effective until the maximum acceleration is reached ($a_{\max} = p2237 [\%] / p2247 [s]$ or $a_{\max} = p2238 [\%] / p2248 [s]$), after which the drive continues to run linearly with constant acceleration. The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time. For bit 03: 0: Non-volatile data save de-activated. 1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1). For bit 04: When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250.

	-	-	0000 0000 bin		
Description:	Sets the configuration of the technology controller.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	04	Ramp-up/ramp-down function generator bypass	De-activated	Activated	-
	05	Integrator active for skip speeds	Yes	No	-
	06	Internal controller limit not displayed	Yes	No	-
Dependency:	For bit 04 = 0: The setting is only effective when the PID controller is de-activated. Refer to: p2280, p2285 For bit 04 = 1 (p2251 = 0): The PID controller can oscillate if the ramp-up and ramp-down times of the speed setpoint channel are not taken into account when setting controller parameters p2280 and p2285.				
Caution:	<div></div> The PID controller can oscillate if the ramp-up and ramp-down times of the speed setpoint channel are not taken into account when setting controller parameters p2280 and p2285.				
Note:	For bit 04 = 0 (only for p2251 = 0): The ramp-function generator in the speed setpoint channel is bypassed when the technology controller is operational. As a consequence, ramp times p1120, p1121 are not taken into consideration when configuring the controller. For bit 04 = 1 (only for p2251 = 0): The ramp-function generator in the speed setpoint channel is not bypassed when the technology controller is operational. As a consequence, the ramp-up and ramp-down times (p1120, p1121) remain effective, and must be taken into account as controlled system variables when setting the PID controller parameters (p2280, p2285). The enable ramps of the PID controller are ensured in this setting by p1120, p1121 as well as rounding functions p1130 and p1131. The ramp-up/ramp-down time of the PID controller limiting p2293 must be set appropriately shorter, as otherwise this has an impact on the speed setpoint channel. For bit 05 = 0: The integral component of the PID controller is held if a skip band or the minimum speed range is passed through in the speed set point channel. This prevents the speed from oscillating between the edges of the skip band. For bit 05 = 1: The setting is only effective if a skip band is no longer active. The integral component of the PID controller is not held in the range of the skip speeds. The skip band is passed through even for small system deviations and low controller gain factors. In so doing, the controller integral time must be selected large enough so that no undesirable speed oscillations occur between the skip band edges. The influence of a minimum speed p1080 on the integration behavior can be reduced by raising the lower PID controller limit to p1080 / p2000 * 100%. For bit 06 = 1: In r2349, bit 10 and bit 11 are not displayed when reaching internal limits (e.g. for OFF1/3).

Description:	Sets the integral time (I component, integrating time constant) of the technology controller.		
Notice:	The following applies for p2251 = 0: If the output of the technology controller lies within the range of a suppression (skip) bandwidth (p1091 ... p1094, p1101) or below the minimum speed (p1080), the integral component of the controller is held so that the controller temporarily works as a P controller. This is necessary in order to prevent the controller from behaving in an unstable manner, as the ramp-function generator switches to the parameterized up and down ramps (p1120, p1121) at the same time in order to avoid setpoint steps. This state can be exited or avoided by changing the controller setpoint or by using the start speed (= minimum speed).		
Note:	When the controller output reaches the limit, the I component of the controller is held. p2285 = 0: The integral time is disabled and the I component of the controller is reset.

	Can be changed: U, T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: 7958
	Min	Max	Factory setting
	0.00 [%]	200.00 [%]	0.00 [%]
Description:	Sets the start value for the output of the technology controller. If the drive is switched on and the technology controller is already enabled (see p2200, r0056.3), then its output signal r2294 first goes to the start value p2302, before the controller starts to operate.		
Dependency:	The starting value is only effective in the mode "technology controller as main speed setpoint" (p2251 = 0). If the technology controller is first enabled when the drive is switched on, a start speed remains ineffective, and the controller output starts with the actual setpoint speed of the ramp-function generator.		
Note:	If the technology controller operates on the speed/setpoint channel (p2251 = 0), then the starting value is interpreted as the starting speed and when operation is enabled, is connected to the output of the technology controller (r2294). If fault F07426 "technology controller actual value limited" occurs while ramping up to the starting value and if the associated reaction has been set to "NONE" (see p2100, p2101), the starting value is kept as the speed setpoint instead of a switch to closed-loop control operation.		
p2306	Technology controller system deviation inversion / Tec_ctr SysDev inv		
	Access level: 3	Calculated: -	Data type: Integer16
	Can be changed: T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: 7958
	Min	Max	Factory setting
	0	1	0
Description:	Setting to invert the system deviation of the technology controller.		
	The setting depends on the type of control loop.		
Value:	0: No inversion		
	1: Inversion		
Caution:			
Note:	If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate! The correct setting can be determined as follows: - inhibit the technology controller (p2200 = 0). - increase the motor speed and in so doing, measure the actual value signal (of the technology controller). - if the actual value increases with increasing motor speed, then the inversion should be switched out. - if the actual value decreases with increasing motor speed, then the inversion should be set. If value = 0: The drive reduces the output speed when the actual value rises (e.g. for heating fans, intake pump, compressor). If value = 1: The drive increases the output speed when the actual value increases (e.g. for cooling fans, discharge pumps).		
p2339	Techn. controller threshold value f. l comp. hold for skip speed / Tec_ctrl thr_skip		
	Access level: 3	Calculated: -	Data type: FloatingPoint32

	Unit group: 9_1	Unit selection: p0595	Func. diagram: -
	Min	Max	Factory setting
	0.00 [%]	200.00 [%]	2.00 [%]
Description:	Sets the threshold value for the system deviation of the technology controller, which controls holding the controller integral component in the range of the skip speeds of the ramp-function generator.		
Recommendation:	To avoid speed setpoint steps in the range of the skip speeds, we recommend setting p2252 bit 4 = 1 (ramp-function generator bypass de-activated).		
Dependency:	The parameter has no effect for p2252 bit 5 = 1 (integrator hold de-activated). Refer to: r2273		

Note: Only p2251 = 0:
If the output signal of the technology controller reaches a skip band in the speed setpoint channel, then the integral component of the controller is held, if at the same time, the system deviation is lower than the threshold value set here. By holding the integral component, it can be avoided that the controller oscillates in the range of the skip bands.

	Unit group: -	Unit selection: -	Func. diagram: 7958
	Min	Max	Factory setting
	- [%]	- [%]	- [%]
Description:	Displays the smoothed speed setpoint of the technology controller prior to switching to operation with fault response (see p2345).		
Dependency:	Refer to: p2345		
Note:	Smoothing time = 10 s		

p2345	Technology controller fault response / Tech_ctrl flt resp		
	Access level: 3	Calculated: -	Data type: Integer16
	Can be changed: U, T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: 7958
	Min	Max	Factory setting
	0	2	0
Description:	Sets the response of the technology controller to the occurrence of fault F07426 (technology controller actual value limited). The fault response is executed if status bit 8 or 9 in the technology controller status word r2349 is set. If both status bits are zero, a switch back to technology controller operation will follow.		
Value:	0: Function inhibited 1: On fault: Changeover to r2344 (or p2302) 2: On fault: Changeover to p2215		
Dependency:	The parameterized fault response is only effective if the technology controller mode is set to p2251 = 0 (technology controller as main setpoint). Refer to: p2267, p2268, r2344 Refer to: F07426		
Notice:	Dependent upon the application, the changing over of the setpoint when fault F07426 occurs can lead to the fault condition disappearing and the re-activation of the technology controller. This can repeat itself and cause limit oscillations. In this case, a different fault response or a different fixed setpoint 15 for the fault response p2345 = 2 should be selected.		
Note:	The parameterized fault response can only be achieved if the default fault response of the technology controller fault F07426 is set to "NONE" (see p2100, p2101). If a fault response other than "NONE" is entered in p2101 for F07426, p2345 must be set to zero. If the fault occurs during ramping up to the starting setpoint p2302, this starting setpoint is retained as the final value (there is no changeover to the fault response setpoint).

p2350	Enable PID autotuning / PID autotuning		
	Access level: 2	Calculated: -	Data type: Integer16
	Can be changed: T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	4	0

Description: Activates the function to automatically tune the PID controller.

Value:

- 0: PID autotuning de-activated
- 1: PID autotuning with ZN technique
- 2: As 1 with low overshoot
- 3: As 2 + low or no overshoot
- 4: PID autotuning, only PI

Dependency: Active if the PID controller is enabled (see P2200).

Note: P2350 = 1
This is the Ziegler-Nichols standard tuning (ZN tuning). In this case, it should involve a response to a step.

P2350 = 2
For this tuning, a low overshoot is obtained (O/S). However, it should be faster than option 1.

P2350 = 3
For this tuning, a low or no overshoot is obtained. However, it is not as fast as option 2.

P2350 = 4
For this tuning, only values P and I are changed, and it should involve a dampened response.

Which option should be selected depends on the particular application. It can be generally stated that option 1 manifests a good response. However, if a faster response is required, then option 2 should be selected.

If no overshoot is desirable, then option 3 should be the preferred choice.

Option 4 should be selected for cases in which no D component is required.

The tuning technique is identical for all options.

Only the P, I and D values are calculated differently.

This parameter is set to zero after automatic tuning has been completed.

Note:

For bit 00:

Hardware or software malfunction was identified. Carry out a POWER ON of the component involved. If it occurs again, contact Technical Support.

For bit 01:

A line supply fault has occurred (phase failure, voltage level, ...). Check the line supply / fuses. Check the supply voltage. Check the wiring.

For bit 02:

The DC link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings.

For bit 03:

An inadmissible operating state of the power electronics was identified (overcurrent, overtemperature, IGBT failure, ...). Check that the permissible load cycles are maintained. Check the ambient temperatures (fan).

For bit 04:

The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet cooling.

For bit 05:

A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cable (connection). Check the motor.

For bit 06:

The motor was operated outside the permissible limits (temperature, current, torque, ...). Check the load cycles and limits that have been set. Check the ambient temperature / motor cooling.

For bit 07:

The communication to the higher-level control system (internal coupling, PROFIBUS, PROFINET, ...) is faulted or interrupted. Check the state of the higher-level control system. Check the communication connection/wiring. Check the bus configuration / clock cycles.

For bit 08:

A safety operation monitoring function (Safety) has detected an error.

For bit 09:

When evaluating the encoder signals (track signals, zero marks, absolute values, ...) an illegal signal state was detected. Check the encoder / state of the encoder signals. Observe the maximum frequencies.

For bit 10:

The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant design. Observe the maximum permissible quantity structure / clock cycles.

For bit 11:

The infeed is faulted or has failed. Check the infeed and the surroundings (line supply, filter, reactors, fuses, ...). Check the closed-loop infeed control.

For bit 15:

Group fault. Determine the precise cause of the fault using the commissioning tool.

Description:	Setting for the friction characteristic record. After the next switch-on command, the friction characteristic is automatically recorded.		
Value:	0: Friction characteristic record de-activated 1: Friction char record activated for all directions 2: Friction char record activated for positive direction 3: Friction char record activated for negative direction		
Dependency:	When selecting the friction characteristic measurement, the drive data set changeover is suppressed. For linear drives (refer to r0108 bit 12) it is not permissible to carry out the friction characteristic measurement for mechanical systems that limit travel.		
Danger:	For drives with a mechanical system that limit the distance moved, it must be ensured that during recording, the friction characteristic is not reached. If this is not the case, then it is not permissible that the measurement is carried out.		
			
Notice:	To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).		
Note:	When the friction characteristic record is active, it is not possible to save the parameters (p0971, p0977). When the friction characteristic record is active (p3845 > 0), it is not possible to change p3820 ... p3829, p3830 ... p3839 and p3842. When recording the friction characteristic, in addition to the friction, the motor losses are also determined (e.g. iron losses, eddy current losses and re-magnetizing losses). A differentiation is not made between these individual loss components. We recommend that a motor temperature sensor is used because torque deviations can also be emulated/mapped on the characteristic due to the thermal influence.

	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0.00 [%]	250.00 [%]	0.00 [%]
Description:	Compound braking current is used to define the amount of DC current that is produced on stopping the motor during U/f operation to further increase the DC brake function. Compound braking is a superimposition of the DC brake function with regenerative braking (net braking along the ramp) after OFF1 or OFF3. This permits braking with controlled motor frequency and minimum power input into the motor. Effective braking without using additional hardware components is obtained by optimizing the ramp down time and compound braking.		
Dependency:	The compound braking current is only activated if the DC link voltage exceeds the threshold value in r1282. Compound braking does not operate in the following cases: - DC braking activated (p1230, r1239). - motor is still not magnetized (e.g. for flying restart). - vector control parameterized (p1300 >= 20). - synchronous motor used (p0300 = 2xx).		
Notice:	Generally, increasing the braking current improves the braking effect when stopping the motor. However, if the value is set too high, then the drive can be tripped (shut down) as a result of overcurrent or ground fault. Recommendation: $p3856 < 100 \% \times (r0209 - r0331) / p0305 / 2$ Compound braking generates a current in the motor with a ripple manifesting the rotational frequency. The higher the braking current is set, the higher the resulting ripple, especially when the Vdc_max control is simultaneously active (refer to p1280).		
Note:	The parameter value is entered relative to the rated motor current (p0305). Compound braking is de-activated with p3856 = 0%.

Dependency:	Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)			
Note:	For bit 00: For significant differences between the motor and load moment of inertia, or for low dynamic performance of the controller, then the P controller becomes a PD controller in the position control loop. As a consequence, the dynamic performance of the position controller is increased. This function should only be set when the speed pre-control (bit 3 = 1) or the torque pre-control (bit 4 = 1) is active. For bit 01: At low speeds, the controller gain factors are automatically reduced in order to avoid noise and oscillation at standstill. For bit 02: The estimated load moment of inertia is taken into account for the speed controller gain (see p5273). For bit 03: Activates the speed pre-control for the basic positioner (EPOS). For bit 04: Activates the torque pre-control for the basic positioner (EPOS). For bit 05: The maximum setpoint acceleration for the basic positioner (EPOS) is determined based on the estimated moment of inertia. This is realized by activating the bit once. The prerequisite is that the drive pulses are inhibited, and the moment of inertia was previously determined. For bit 06: The speed controller gain set in p1460 is not changed when calculating the controller data.

2 Parameters

2.2 List of parameters

The estimated moment of inertia is obtained according to the following formula:

Moment of inertia (J) = linear coefficient (p5314) * load torque + constant coefficient (p5315)

Dependency: The function module "Moment of inertia estimator" (r0108.10) must be activated for the "Moment of inertia precontrol" function.

Not visible with application class: "Standard Drive Control" (SDC, p0096 = 1)

Refer to: p5310, r5311, p5312, p5313, p5314

Description:	Sets the boost factor for the copper losses at standstill for motor temperature models 1 and 3. The entered factor is active for speed n = 0 [rpm]. This factor is linearly reduced down to 1 between speeds n = 0 ... 1 [rpm]. The following values are required to calculate the boost factor: - stall current (I_0, p0318, catalog value) - thermal stall current (I_th0, catalog value) The boost factor is calculated as follows: - p5350 = (I_0 / I_th0)^2		
Dependency:	Refer to: p0318, p0612, p5390, p5391 Refer to: F07011, A07012, A07014		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	Temperature model 1 (I2t): The following applies for firmware version < 4.7 SP6 or p0612.8 = 0: - parameter p5350 is not active. Internally, a fixed boost factor of 1.333 is used as basis for the calculation. The following applies from firmware version 4.7 SP6 and p0612.8 = 1: - parameter p5350 becomes active as described above.

Dependency: Refer to: r0034, p0612, r0632
Refer to: F07011, A07012, A07910

Note: For bit 00, 04:
The motor temperature is measured using a temperature sensor (p0600, p0601). When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.
For bit 01, 05:
The motor temperature is monitored based on a temperature model (p0612). When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.
For bit 02:
The encoder temperature is measured using a temperature sensor. When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.
For bit 08:
When reaching the motor temperature alarm threshold, reduction of the maximum current is set as response (p0610 = 1). When the bit is set, reduction of the maximum current is active.

p5390[0...n] Mot_temp_mod 1/3 alarm threshold / A thresh

Access level: 2	Calculated: -	Data type: FloatingPoint32

Min	Max	Factory setting
0.0 [°C]	200.0 [°C]	110.0 [°C]

Description: Sets the alarm threshold for monitoring the motor temperature for motor temperature models 1 and 3.
The stator winding temperature (r0632) is used to initiate the signal.
The following applies for temperature model 1 (l2t):
- only effective from firmware version 4.7 SP6 and p0612.8 = 1.
- Alarm A07012 is output after the alarm threshold is exceeded.
- when commissioning a catalog motor for the first time, the threshold value is copied from p0605 to p5390.
The following applies for temperature model 3:
- after the alarm threshold is exceeded, alarm A07012 is output and a calculated delay time ($t = p5371/p5381$) is started.
- if the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output.

Dependency: Refer to: r0034, p0605, p0612, r0632, p5391
Refer to: F07011, A07012, A07014

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: The hysteresis is 2 K.

0.0 [°C]	200.0 [°C]	120.0 [°C]

Description: Sets the fault threshold for monitoring the motor temperature for motor temperature models 1 and 3.
Fault F07011 is output after the fault threshold is exceeded.
The stator winding temperature (r0632) is used to initiate the signal.

2 Parameters

2.2 List of parameters

The following applies for temperature model 1 (I2t):

- only effective from firmware version 4.7 SP6 and p0612.8 = 1.

- when commissioning a catalog motor for the first time, the threshold value is copied from p0615 to p5391.

Dependency: Refer to: r0034, p0612, p0615, r0632, p5390

Refer to: F07011, A07014

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: The hysteresis is 2 K.

Dependency:

Refer to: p7765, p7766, p7767, p7768

Note:

KHP: Know-How Protection

- the OEM may only change this parameter for the use case "Sending encrypted SINAMICS data".

- SINAMICS only evaluates this parameter when powering up from the encrypted "Load into file system..." output or when powering up from the encrypted PS files. The evaluation is only made when know-how protection and memory card copy protection have been activated.

Dependency:

Refer to: p7761, p7765, p7766, p7767, p7768

Note:

KHP: Know-How Protection

For bit 00:

Write protection can be activated/de-activated via p7761 on the Control Unit.

For bit 01:

The know-how protection can be activated by entering a password (p7766 ... p7768).

For bit 02:

If it has already been activated, know-how protection can be temporarily de-activated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

For bit 03:

Know-how protection cannot be de-activated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

For bit 04:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and p7765 bit 00 is set.

For bit 05:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and in p7765 bit 01 is set and not bit 00.

For bit 06:

When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and in p7765.2 is set.

Can be changed: U, T	Scaling: -	Dyn. index: -
Unit group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
-	-	0000 bin

Description:

Configuration settings for know-how protection.

For bit 00, 01:

When KHP is activated, this means that the OEM can define whether the parameters and DCC data encrypted on the memory card should be protected before using on other memory cards/Control Units.

For bit 02:

This means that the OEM can define whether it is possible or not to trace the drive data using the device trace function although KHP is activated.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Extended copy protection - linked to the memory card and CU	Yes	No	-
01	Basic copy protection - linked to the memory card	Yes	No	-
02	Permit trace and measuring functions for diagnostic purposes	Yes	No	-

Dependency: Refer to: p7766, p7767, p7768

Note: KHP: Know-How Protection

For copy protection, the serial numbers of the memory card and/or Control Unit are checked.

The memory card copy protection and preventing data to be traced are only effective when the know-how protection has been activated.

For bit 00, 01:

If both bits are inadvertently set to 1 (e.g. at the BOP), then the setting of bit 0 applies.

There is no copy protection if both bits are set to 0.

Description:

Sets the password for know-how protection.

Example of a password:

123aBc = 49 50 51 97 66 99 dec (ASCII characters)

[0] = character 1 (e.g. 49 dec)

[1] = character 2 (e.g. 50 dec)

...

[5] = character 6 (e.g. 99 dec)

[29] = 0 dec (completes the entry)

Dependency:

Refer to: p7767, p7768

Notice:

An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

When using the STARTER commissioning software, the password should be entered using the associated dialogs.

The following rules apply when entering the password:

- Password entry must start with p7766[0].

- no gaps are permissible in the password.

- Entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters).

2.2 List of parameters

Note: KHP: Know-How Protection
When reading, p7766[0...29] = 42 dec (ASCII character = "***") is displayed.
Parameters with the "KHP_WRITE_NO_LOCK" attribute are not involved in the know-how protection.
Parameters with the "KHP_ACTIVE_READ" attribute can be read even when know-how protection is activated.
A product-specific list of these parameters is also available in the corresponding List Manual.

Notice: For value = 2, 3:

These actions are only possible when pulses are inhibited.

Note: After the action has been successfully completed, the parameter is automatically set to zero.

The actions importing and deleting NVRAM data immediately initiate a warm restart.

If the procedure was not successfully completed, then an appropriate fault value is displayed (p7775 >= 10).

Description:	Sets the configuration for the content of identification and maintenance 4 (I&M 4, p8809).		
Value:	0: Standard value for I&M 4 (p8809) 1: User value for I&M 4 (p8809)		
Dependency:	For p8805 = 0, if the user writes at least one value in p8809[0...53], then p8805 is automatically set to = 1. When p8805 is reset = 0, then the content of the factory setting is set in p8809.		
Note:	For p8805 = 0: PROFINET I&M 4 (p8809) contains the information for the SI change tracking. For p8805 = 1: PROFINET I&M 4 (p8809) contains the values written by the user.

Description:	Parameters for the PROFINET data set "Identification and Maintenance 2" (I&M 2). This information is known as "Installation date".		
Dependency:	Refer to: p8806, p8808		

2 Parameters

2.2 List of parameters

Note: An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.
For p8807[0...15]:
Dates of installation or first commissioning of the device with the following format options (ASCII):
YYYY-MM-DD
or
YYYY-MM-DD hh:mm
- YYYY: year
- MM: month 01 ... 12
- DD: day 01 ... 31
- hh: hours 00 ... 23
- mm: minutes 00 ... 59
Separators must be placed between the individual data, i.e. a hyphen '-', space ' ' and colon ':'.

p8808[0...53] Identification and Maintenance 3 / I&M 3

	0000 bin	1111 1111 bin	0000 bin
Description:	Parameters for the PROFINET data set "Identification and Maintenance 4" (I&M 4). This information is known as "Signature".		
Dependency:	This parameter is pre-assigned as standard (see note). After writing information to p8809, p8805 is automatically set to = 1. Refer to: p8805		
Note:	For p8805 = 0 (factory setting) the following applies: Parameter p8809 contains the information described below. For p8809[0...3]: Contains the value from r9781[0] "SI change tracking checksum functional". For p8809[4...7]: Contains the value from r9782[0] "SI change tracking time stamp checksum functional". For p8809[8...53]: Reserved.		

r8854 PROFINET state / PN state			
CU240E-2 PN	Access level: 4	Calculated: -	Data type: Integer16

	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	255	-
Description:	State display for PROFINET.		

Value:	0:	No initialization
	1:	Fatal fault
	2:	Initialization
	3:	Send configuration
	4:	Receive configuration
	5:	Non-cyclic communication
	6:	Cyclic communications but no setpoints (stop/no clock cycle)
	255:	Cyclic communication

r8858[0...39] PROFINET read diagnostics channel / PN diag_chan read

CU240E-2 PN	Access level: 4	Calculated: -	Data type: Unsigned16

	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	-	-	-
Description:	Sets the station name for the onboard PROFINET interface on the Control Unit. The actual station name is displayed in r8930.		
Dependency:	Refer to: p8925, r8930		
Note:	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual. The interface configuration (p8920 and following) is activated with p8925. The parameter is not influenced by setting the factory setting. PN: PROFINET		

p8921[0...3]	PN IP address / PN IP addr		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Unsigned8
CU240E-2_PN_F	Can be changed: U, T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	255	0
Description:	Sets the IP address for the onboard PROFINET interface on the Control Unit. The actual IP address is displayed in r8931.		
Dependency:	Refer to: p8925, r8931		
Note:	The interface configuration (p8920 and following) is activated with p8925. The parameter is not influenced by setting the factory setting.		

p8922[0...3]	PN Def Gateway / PN Def Gateway		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Unsigned8
CU240E-2_PN_F	Can be changed: U, T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	255	0
Description:	Sets the default gateway for the onboard PROFINET interface on the Control Unit. The actual standard gateway is displayed in r8932.		
Dependency:	Refer to: p8925, r8932		
Note:	The interface configuration (p8920 and following) is activated with p8925. The parameter is not influenced by setting the factory setting.		

p8923[0...3]	PN Subnet Mask / PN Subnet Mask		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Unsigned8
CU240E-2_PN_F	Can be changed: U, T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	255	0
Description:	Sets the subnet mask for the onboard PROFINET interface on the Control Unit. The actual subnet mask is displayed in r8933.		

Dependency: Refer to: p8925, r8933
Note: The interface configuration (p8920 and following) is activated with p8925.
The parameter is not influenced by setting the factory setting.

p8924	PN DHCP Mode / PN DHCP mode		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Integer16
CU240E-2_PN_F	Can be changed: U, T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	3	0
Description:	Sets the DHCP mode for the onboard PROFINET interface on the Control Unit. The actual DHCP mode is displayed in r8934.		
Value:	0: DHCP off 2: DHCP on, identification using MAC address 3: DHCP on, identification via name of station		
Dependency:	Refer to: p8925, r8934		
Notice:	When the DHCP mode is active (p8924 not equal to 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool.		
Note:	The interface configuration (p8920 and following) is activated with p8925. The active DHCP mode is displayed in parameter r8934. The parameter is not influenced by setting the factory setting.		

p8925	PN interface configuration / PN IF config		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Integer16
CU240E-2_PN_F	Can be changed: U, T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	3	0
Description:	Setting to activate the interface configuration for the onboard PROFINET interface on the Control Unit. p8925 is automatically set to 0 at the end of the operation.		
Value:	0: No function 1: Reserved 2: Save and activate configuration 3: Delete configuration		
Dependency:	Refer to: p8920, p8921, p8922, p8923, p8924		
Notice:	When the DHCP mode is active (p8924 > 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool.		
Note:	For p8925 = 2: The interface configuration (p8920 and following) is saved and activated after the next POWER ON. For p8925 = 3: The factory setting of the interface configuration is loaded after the next POWER ON.		

p8929	PN remote controller number / PN rem ctrl num		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Integer16
CU240E-2_PN_F	Can be changed: C	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	1	2	1
Description:	Sets the number of remote controllers expected for PROFINET onboard. The "Shared Device" functionality is activated with a value = 2. The drive is being accessed by two PROFINET controllers simultaneously: - automation controller (SIMOTION or SIMATIC A-CPU). - safety controller (SIMATIC F-CPU).		
Value:	1: Automation or Safety 2: Automation and Safety		

2 Parameters

2.2 List of parameters

Notice: The F CPU may only use PROFIsafe telegrams.
Note: Changes only become effective after POWER ON.

	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	255	-
Description:	Displays the actual subnet mask for the onboard PROFINET interface on the Control Unit.		
r8934	PN DHCP Mode actual / PN DHCP Mode act		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Integer16
CU240E-2_PN_F	Can be changed: -	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	3	-
Description:	Displays the actual DHCP mode for the onboard PROFINET interface on the Control Unit.		
Value:	0: DHCP off 2: DHCP on, identification using MAC address 3: DHCP on, identification via name of station		
Notice:	When the DHCP mode is active (parameter value not equal to 0), PROFINET communication via this interface is no longer possible! However, the interface can be used for commissioning tool such as STARTER or SCOUT.		

r8935[0...5]	PN MAC address / PN MAC addr		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Unsigned8
CU240E-2_PN_F	Can be changed: -	Scaling: -	Dyn. index: -

CU240E-2_PN_F	Can be changed: -	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	-	-	-
Description:	Displays the PROFINET Device Access Point ID (DAP ID) for the onboard PROFINET interface. The combination of device ID (r8909) and DAP ID uniquely identifies a PROFINET access point.		
Note:	List of the SINAMICS DAP IDs: 20007 hex: CBE20 V4.5 20008 hex: CBE20 V4.6 20107 hex: CU310-2 PN V4.5 20108 hex: CU310-2 PN V4.6 20307 hex: CU320-2 PN V4.5 20308 hex: CU320-2 PN V4.6 20407 hex: CU230P-2 PN /CU240x-2 PN V4.5 20408 hex: CU230P-2 PN /CU240x-2 PN /CU250S-2 PN /G110M PN V4.6 20507 hex: CU250D-2 PN V4.5 20508 hex: CU250D-2 PN V4.6		
r8960[0...2]	PN subslot controller assignment / PN subslot assign		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Unsigned8
CU240E-2_PN_F	Can be changed: -	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	8	-
Description:	Displays the controller assignment of a PROFINET subslot on the actual drive object.		
Index:	[0] = Subslot 2 PROFIsafe [1] = Subslot 3 PZD telegram [2] = Subslot 4 PZD supplementary data		
Dependency:	Refer to: r8961, r8962		
Note:	Example: If the parameter contains the value 2 in index [1], then this means that subslot 3 is assigned to controller 2.		
r8961[0...3]	PN IP Address Remote Controller 1 / IP Addr Rem Ctrl1		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Unsigned8
CU240E-2_PN_F	Can be changed: -	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	255	-
Description:	Displays the IP address of the first PROFINET controller connected with the device via PN onboard.		

2 Parameters

2.2 List of parameters

r8962[0...3]	PN IP Address Remote Controller 2 / IP Addr Rem Ctrl2		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Unsigned8

	0	255	-
Description:	Displays the IP address of the second PROFINET controller connected with the device via PN onboard.		
p8980	Ethernet/IP profile / Eth/IP profile		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Integer16
CU240E-2_PN_F	Can be changed: T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: 2473
	Min	Max	Factory setting
	0	1	0
Description:	Sets the profile for Ethernet/IP.		
Value:	0: SINAMICS 1: ODVA AC/DC		
Note:	Changes only become effective after POWER ON. The parameter is not influenced by setting the factory setting. ODVA: Open DeviceNet Vendor Association		
p8981	Ethernet/IP ODVA STOP mode / Eth/IP ODVA STOP		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Integer16
CU240E-2_PN_F	Can be changed: T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: 2473
	Min	Max	Factory setting
	0	1	0
Description:	Sets the STOP mode for the Ethernet/IP ODVA profile (p8980 = 1).		
Value:	0: OFF1 1: OFF2		
Dependency:	Refer to: p8980		
Note:	Changes only become effective after POWER ON. The parameter is not influenced by setting the factory setting.		
p8982	Ethernet/IP ODVA speed scaling / Eth/IP ODVA n scal		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Integer16
CU240E-2_PN_F	Can be changed: T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	123	133	128
Description:	Sets the scaling for the speed for Ethernet/IP ODVA profile (p8980 = 1).		
Value:	123: 32 124: 16 125: 8 126: 4 127: 2 128: 1 129: 0.5 130: 0.25 131: 0.125 132: 0.0625 133: 0.03125		
Dependency:	Refer to: p8980		

Note: Changes only become effective after POWER ON.
The parameter is not influenced by setting the factory setting.

p8983	Ethernet/IP ODVA torque scaling / Eth/IP ODVA M scal		
CU240E-2 PN	Access level: 3	Calculated: -	Data type: Integer16
CU240E-2_PN_F	Can be changed: T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	123	133	128
Description:	Sets the scaling for the torque for Ethernet/IP ODVA profile (p8980 = 1).		
Value:	123: 32 124: 16 125: 8 126: 4 127: 2 128: 1 129: 0.5 130: 0.25 131: 0.125 132: 0.0625 133: 0.03125		
Dependency:	Refer to: p8980		
Note:	Changes only become effective after POWER ON. The parameter is not influenced by setting the factory setting.		

p8991	USB memory access / USB mem acc		
	Access level: 3	Calculated: -	Data type: Integer16
	Can be changed: T	Scaling: -	Dyn. index: -
	Unit group: -	Unit selection: -	Func. diagram: -

CU240E-2_F	Min	Max	Factory setting
	-	-	0000 0000 1111 1111 bin

Description: Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	08	SDI during pulse suppression and sensorless	Becomes inactive	Remains active	-

Dependency: Refer to: C01711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

For bit 00:

If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

Note: SDI: Safe Direction (safe motion direction)

SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)

For bit 00:

For bit = 1 and with the SSM safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.

For bit = 0 and with the SSM safety function activated, the following applies:

- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.

For bit 08:

For bit = 1 and with the SDI safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the status signal indicates inactive.

For bit = 0 and with the SDI safety function activated, the following applies:

- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

CU240E-2_DP_F	0.00 [μs]	100000.00 [μs]	0.00 [μs]

Description: Sets the filter time for the SSM feedback signal to detect standstill.

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The filter time is effective only if the function is enabled (p9301.16 = p9501.16 = 1).
The set time is rounded internally to an integer multiple of the monitoring clock cycle.
The parameter is included in the crosswise data comparison of the two monitoring channels.

Description: Sets the velocity limit for the SSM feedback signal to detect standstill ($n < nx$).

When this limit value is undershot, the signal "SSM feedback signal active" is set.

Dependency: Refer to: p9546

Caution: The following applies for p9306 = 3:

The "SAM" function is switched out if the selected threshold value is undershot.

Description: Sets the delay time for monitoring the brake ramp.
Monitoring of the brake ramp starts once the delay time has elapsed.

Dependency: Refer to: p9381, p9383

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The set time is rounded internally to an integer multiple of the monitoring clock cycle.
Internally, the set time is limited downwards to 2 safety monitoring clock cycles (2 * 12 ms).

CU240E-2_F	Min	Max	Factory setting
CU240E-2_PN_F	-1	4	-1
CU240E-2_DP_F			

Description: Sets the tolerance of the plausibility monitoring of the current and voltage angle.

A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps.

An increase is advantageous, if the current or voltage at the motor become small.

Dependency:

Refer to: p9507

Refer to: F30681, C30711

Notice:

This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Reducing this value can adversely affect the actual value sensing and the plausibility check.

When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).

Note:

This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

For synchronous motors, the value 4 must be set.

If value = -1:

- for synchronous motors, the calculation is automatically made with the value 4.

- for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

Description:

Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled.

The value must be greater than or equal to the motor magnetizing time (p0346).

Dependency:

Refer to: C30711

Caution:

The safety functionality is only completely guaranteed after this time has expired.

**Notice:**

This parameter is overwritten by the copy function of the safety functions integrated in the drive.

If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C30711 with the message value 1041 or 1042.

Note:

This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

- the value must be increased if C30711 has occurred with message value 1042.

- the value must be decreased if C30711 has occurred with message value 1041.

2 Parameters

2.2 List of parameters

For synchronous motors, the following condition must be fulfilled:

$$|p0305 \times p9783| \geq p9388 \times 1.2$$

Recommendation: If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

Dependency: Refer to: r9785
Refer to: C30711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.
If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.

CU240E-2_PN_F	10.00 [%]	3300.00 [%]	100.00 [%]
CU240E-2_DP_F			

Description: Sets the acceleration limit to filter velocity fluctuations.
If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.
If this value is decreased, and this dampens the velocity peaks when accelerating.
- the value must be increased if C30711 with message value 1043 has occurred.
- the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.

Recommendation: The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.
To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9389, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

Dependency: Refer to: r9784
Refer to: C30711

Description: Setting and display when memory card is "removed safely".
 Procedure:
 Setting p9400 = 2 results in a value of 3
 --> The memory card can be removed safely. After removal the value sets itself to 0 automatically.
 Setting p9400 = 2 results in a value of 100
 --> The memory card cannot be removed safely. Removal may destroy the file system on the memory card. It may be necessary to set p9400 = 2 again.

Value:

0:	No memory card inserted
1:	Memory card inserted
2:	Request "safe removal" of the memory card
3:	"Safe removal" possible
100:	"Safe removal" not possible due to access

Dependency: Refer to: r9401

Notice: Removing the memory card without a request (p9400 = 2) and confirmation (p9400 = 3) may destroy the file system on the memory card. The memory card will then no longer work properly and must be replaced.

Note: The status when the memory card is being "removed safely" is shown in r9401.

For bit 00:
For bit = 1 and with the SSM safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.
For bit = 0 and with the SSM safety function activated, the following applies:
- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.
For bit 08:
For bit = 1 and with the SDI safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the status signal indicates inactive.
For bit = 0 and with the SDI safety function activated, the following applies:
- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

CU240E-2_PN_F	Min	Max	Factory setting
CU240E-2_DP_F	-	-	0000 0000 1111 1111 bin

Description: Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	SSM during pulse suppression and sensorless	Becomes inactive	Remains active	-
	08	SDI during pulse suppression and sensorless	Becomes inactive	Remains active	-

Dependency: Refer to: C01711

Notice: For bit 00:
If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

Note: SDI: Safe Direction (safe motion direction)
SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)
For bit 00:
For bit = 1 and with the SSM safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.
For bit = 0 and with the SSM safety function activated, the following applies:
- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.
For bit 08:
For bit = 1 and with the SDI safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the status signal indicates inactive.
For bit = 0 and with the SDI safety function activated, the following applies:
- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

Description:	This is an evaluation factor to define the setpoint limit from the selected actual speed limit. The active SLS limit value is evaluated with this factor and is made available as setpoint limit in r9733.		
Dependency:	This parameter only has to be parameterized for the motion monitoring functions integrated in the drive (p9601.2 = 1) r9733[0] = p9531[x] x p9533 (converted from the load side to the motor side) r9733[1] = - p9531[x] x p9533 (converted from the load side to the motor side) [x] = Selected SLS stage Conversion factor from the motor side to the load side: - motor type = rotary and axis type = linear: p9522 / (p9521 x p9520) - otherwise: p9522 / p9521 Refer to: p9501, p9531, p9601		
Note:	The active actual speed limit is selected via PROFIsafe. With STOP A, B, setpoint 0 is specified in r9733. For p9533 = 0, the setpoint speed limit is de-activated and r9733[0] is set to p1082 and r9733[1] is set to -p1082. SLS: Safely Limited Speed

CU240E-2_F	Min	Max	Factory setting
CU240E-2_PN_F	-1	4	-1
CU240E-2_DP_F			
Description:	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.		
Dependency:	Refer to: r9787 Refer to: F01681, C01711		
Notice:	Reducing this value can adversely affect the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).

2.2 List of parameters

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
For synchronous motors, the value 4 must be set.
If value = -1:
- for synchronous motors, the calculation is automatically made with the value 4.
- for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

CU240E-2_PN_F	5.00 [ms]	1000.00 [ms]	100.00 [ms]
CU240E-2_DP_F			

Description: Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled.
The value must be greater than or equal to the motor magnetizing time (p0346).

Dependency: Refer to: C01711

Caution: The safety functionality is only completely guaranteed after this time has expired.

Notice: If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C01711 with the message value 1041 or 1042.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
The set time is rounded internally to an integer multiple of the monitoring clock cycle.

CU240E-2_PN_F	0.00 [%]	1000.00 [%]	10.00 [%]
CU240E-2_DP_F			

Description: Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA).
- the value must be increased if C01711 has occurred with message value 1042.
- the value must be decreased if C01711 has occurred with message value 1041.
For synchronous motors, the following condition must be fulfilled:
 $|p0305 \times p9783| \geq p9588 \times 1.2$

Recommendation: If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

Dependency: Refer to: r9785
Refer to: C01711

Notice: If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.

Description:	<p>Sets the acceleration limit to filter velocity fluctuations.</p> <p>If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.</p> <p>If this value is decreased, and this dampens the velocity peaks when accelerating.</p> <ul style="list-style-type: none"> - the value must be increased if C01711 with message value 1043 has occurred. - the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity. 		
Recommendation:	<p>The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.</p> <p>To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9589, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.</p>

Description: Sets the discrepancy time for the changeover of the failsafe digital input for STO on processor 1.

An F-DI changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an F-DI changeover, dynamic data is not subject to a crosswise data comparison during this discrepancy time.

Dependency: Refer to: p9850

Note: For a crosswise data comparison between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated.

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

Description: Sets the debounce time for the failsafe digital inputs used to control the "STO" function.

The debounce time is rounded to whole milliseconds.

Note: The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the fail-safe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions.

Example:

Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.

Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

CU240E-2_DP_F	Unit group: -	Unit selection: -	Func. diagram: -

	- [rpm]	- [rpm]	- [rpm]
Description:	Displays the velocity resolution for safety-relevant motion monitoring functions. For index 0: Displays the safe velocity resolution (load side). Setpoints for velocity limits or parameter changes for velocities below this threshold have no effect. For index 1: Displays the safe velocity accuracy based on the safe encoder accuracy		
Index:	[0] = Actual velocity resolution [1] = Minimum velocity resolution		
Note:	Index 0: This parameter does not provide any information about the actual accuracy of the velocity sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used. Index 1: For a two-encoder system, with just non-safety capable encoders, this means the poorer value of the two encoders. Index[1] takes into account the coarse resolution of the encoder only

CU240E-2_DP_F				
Description:	Displays the necessary setpoint speed limit as a result of the selected motion monitoring functions. Contrary to the parameterization of the SI limit values, this parameter specifies the motor-side limit value and not the load-side limit value.			
Recommendation:	For the ramp-function generator, by appropriately interconnecting the speed limits p1051 and p1052 with r9733[0, 1], a drive-based setpoint velocity limiting can be realized. - CI: p1051 = r9733[0] - CI: p1052 = r9733[1] Additional limiting can also be activated using connector input p1085 and p1088.			
Index:	[0] = Setpoint limiting positive [1] = Setpoint limiting negative [2] = Setpoint limit absolute			
Dependency:	For SLS: r9733[0] = p9531[x] x p9533 (converted from the load side to the motor side) For SDI negative: r9733[0] = 0 For SLS: r9733[1] = - p9531[x] x p9533 (converted from the load side to the motor side) For SDI positive: r9733[1] = 0 [x] = Selected SLS stage Conversion factor from the motor side to the load side: - motor type = rotary and axis type = linear: p9522 / (p9521 x p9520) - otherwise: p9522 / p9521 Refer to: p9531, p9533			
Notice:	If p1051 = r9733[0] is interconnected, p1052 = r9733[1] must also be interconnected and vice versa. If only the absolute value of the setpoint velocity limiting is required, r9733[2] must be interconnected.			
Note:	If the "SLS" function is not selected, r9733[0] shows p1082 and r9733[1] shows -p1082. The display in r9733 can be delayed by up to one Safety monitoring clock cycle as compared to the display in r9720 and r9722.

2 Parameters

2.2 List of parameters

000D hex:

Extended functions are enabled via PROFIsafe and basic functions via onboard terminals (permissible for r9771.4 = 1).

In addition to all of the combinations listed above, using bit 7, the "STO via Power Module terminals" function can be enabled (this is permissible for r9771.19 = 1).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Enable STO via terminals (processor 2)	Enable	Inhibit	2810
	03	Enable PROFIsafe (processor 2)	Enable	Inhibit	-

Dependency: Refer to: p9601, r9871

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: A change only becomes effective after a POWER ON.

STO: Safe Torque Off

Description: Sets the enable signals for the safety functions integrated in the drive and the type of selection on processor 2.
Not all of the settings listed below will be permissible, depending on the Control Unit and Power Module being used:
0000 hex:
Safety functions integrated in the drive inhibited (no safety function).
0001 hex:
Basic functions are enabled via onboard terminals (permissible for r9771.0 = 1).
0004 hex:
Extended functions are enabled via onboard terminals (permissible for r9771.5 = 1).
0008 hex:
Basic functions are enabled via PROFIsafe (permissible for r9771.6 = 1).
0009 hex:
Basic functions are enabled via PROFIsafe onboard terminals (permissible for r9771.6 = 1).
000C hex:
Extended functions are enabled via PROFIsafe (permissible for r9771.4 = 1).
000D hex:
Extended functions are enabled via PROFIsafe and basic functions via onboard terminals (permissible for r9771.4 = 1).
In addition to all of the combinations listed above, using bit 7, the "STO via Power Module terminals" function can be enabled (this is permissible for r9771.19 = 1).

Bit field:	Bit	Signal name	1 signal	0 signal	FP

CU240E-2_DP			
CU240E-2_PN			
CU240E-2_F			
CU240E-2_PN_F			
CU240E-2_DP_F			

Description: Sets the discrepancy time for the changeover of the failsafe digital input for STO on processor 2.

An F-DI changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an F-DI changeover, dynamic data is not subject to a crosswise data comparison during this discrepancy time.

Dependency: Refer to: p9650

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: For a crosswise data comparison between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated.

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

CU240E-2_PN					
CU240E-2_F					
CU240E-2_PN_F					
CU240E-2_DP_F					
Description:	Sets the debounce time for the failsafe digital inputs used to control the "STO" function. The debounce time is rounded to whole milliseconds.				
Dependency:	Refer to: p9651				
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.				
Note:	Rounding effects can occur in the last decimal place of the parameterized time. The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the fail-safe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions. Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

Description:	Display and BICO output for the single-channel, logical and debounced status of the fail-safe digital inputs (F-DI). The parameter is updated in the SI Motion monitoring clock cycle.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	F-DI 0 processor 1	High	Low	-
	01	F-DI 1 processor 1	High	Low	-
	02	F-DI 2 processor 1	High	Low	-
Dependency:	Refer to: p9501, p9601, p10017, p10050, r10151				
Note:	If a safety function is assigned to an input (e.g. via p10022), then the following applies: - logical "0": Safety function is selected - logical "1": Safety function is de-selected The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10040) of the input as either NC or NO contact and is aligned to the use of a safety function: With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level. This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function. With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level. This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function. F-DI: Failsafe Digital Input The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051. The parameter is only updated in the following cases: - if the Safety Extended Functions are enabled by means of activation via F-DI. - if transfer of the F-DIs via PROFIsafe is enabled (see p9501). In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

Description: Displays the monitoring status of the fail-safe digital inputs (F-DI).

2 Parameters

2.2 List of parameters

The F-DIs that are being used by the Safety Integrated functions are displayed.

If the module used has fewer than 3 F-DIs, "Freely available" is displayed for the F-DIs which are not in use.

Bit field:	Bit	Signal name	1 signal	0 signal	FP

CU240E-2_DP_F	-	-	0000 bin	

Description: Setting for the transfer and evaluation of failsafe digital inputs (F-DI) via PROFIsafe.
The safe state of the selected F-DIs is transferred to the F-control via PROFIsafe. The F-DIs are monitored for discrepancies. Discrepancy faults can be acknowledged via PROFIsafe.

Bit field:	Bit	Signal name	1 signal	0 signal	FP

CU240E-2_F	Min	Max	Factory setting	
CU240E-2_PN_F	-	-	-	
CU240E-2_DP_F	-	-	-	

Description: Display and BICO output for the single-channel, logical and debounced status of the fail-safe digital inputs (F-DI).
The parameter is updated in the SI Motion monitoring clock cycle.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	F-DI 0 processor 2	High	Low	-
	01	F-DI 1 processor 2	High	Low	-
	02	F-DI 2 processor 2	High	Low	-

Dependency: Refer to: p9501, p9601, p10117, p10150

Note: F-DI: Failsafe Digital Input

If a safety function is assigned to an input (e.g. via p10122), then the following applies:

- logical "0": Safety function is selected
- logical "1": Safety function is de-selected

The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10140) of the input as either NC or NO contact and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- if the Safety Extended Functions are enabled by means of activation via F-DI.
- if transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

p8808[0...53]	Identification and Maintenance 3 / I&M 3
p8809[0...53]	Identification and Maintenance 4 / I&M 4

p8980	Ethernet/IP profile / Eth/IP profile
p8981	Ethernet/IP ODVA STOP mode / Eth/IP ODVA STOP
p8982	Ethernet/IP ODVA speed scaling / Eth/IP ODVA n scal
p8983	Ethernet/IP ODVA torque scaling / Eth/IP ODVA M scal
p9400	Safely remove memory card / Mem_card rem
p9484	BICO interconnections search signal source / BICO S_src srch

2.5.3 Parameters with "KHP_ACTIVE_READ"

The following list contains the parameters with the "KHP_ACTIVE_READ" attribute.

These parameters can also be read with activated know-how protection.

Product: SINAMICS G120 CU240, Version: 4707900, Language: eng, Type: KHP_ACTIVE_READ

p0015	Macro drive unit / Macro drv unit
p0100	IEC/NEMA mot stds / IEC/NEMA mot stds
p0170	Number of Command Data Sets (CDS) / CDS count
p0180	Number of Drive Data Sets (DDS) / DDS count
p0300[0...n]	Motor type selection / Mot type sel
p0304[0...n]	Rated motor voltage / Mot U _{rated}
p0305[0...n]	Rated motor current / Mot I _{rated}

Quick commissioning (p0010 = 1)

The parameters required for the quick commissioning (p0010=1) are shown in the following table:

Table 2-7 Quick commissioning (p0010 = 1)

Par. no.	Name	Access level		Can be changed
p0010	Drive, commissioning parameter filter	1		C(1)T
p0015	Macro drive unit	1		C,C(1)
p0096	Application class	1		C(1)
p0100	IEC/NEMA mot stds	1		C(1)
p0205	Power unit application	1		C(1,2)
p0230	Drive filter type, motor side	1		C(1,2)
p0300	Motor type selection	2		C(1,3)
p0301	Motor code number selection	2		C(1,3)
p0304	Rated motor voltage	1		C(1,3)
p0305	Rated motor current	1		C(1,3)
p0306	Number of motors connected in parallel	1		C(1,3)
p0307	Rated motor power	1		C(1,3)
p0308	Rated motor power factor	1		C(1,3)
p0309	Rated motor efficiency	1		C(1,3)
p0310	Rated motor frequency	1		C(1,3)
p0311	Rated motor speed	1		C(1,3)
p0314	Motor pole pair number	3		C(1,3)
p0316	Motor torque constant	3		C(1,3)UT
p0322	Maximum motor speed	1		C(1,3)
p0323	Maximum motor current	1		C(1,3)
p0335	Motor cooling type	2		C(1,3)T
p0500	Technology application	4	PM230	C(1,5)T
p0500	Technology application	2	PM240 PM250 PM260, PM330	C(1,5)T
p0640	Current limit	2		C(1,3)UT
p0922	PROFIdrive telegram selection	1		C(1)T
p0970	Reset drive parameters	1		C(1,30)
p1080	Minimum speed	1		C(1)T
p1082	Maximum rotation speed	1		C(1)T
p1120	Ramp-function generator ramp-up time	1		C(1)UT
p1121	Ramp-function generator ramp-down time	1		C(1)UT
p1135	OFF3 ramp-down time	2		C(1)UT

Table 2-7 Quick commissioning (p0010 = 1), continued

Par. no.	Name	Access level		Can be changed
p1300	Open-loop/closed-loop control operating mode	2		C(1)T
p1500	Torque setpoint selection	2		C(1)T
p1900	Motor data identification and rotating measurement	2		C(1)T
p1905	Parameter tuning selection	1		C(1)T
p2196	Torque utilization scaling	1		C(1,3)UT
p3900	Completion of quick commissioning	1		C(1)

If p0010 = 1 is selected, p0003 (user access level) can be used to select the parameters that are to be accessed.

At the end of the quick commissioning, set p3900 = 1 to perform the required motor calculations and reset all other parameters (not included in p0010 = 1) to their default settings.

Note

This only applies for the quick commissioning.

Symbols for computational and closed-loop control functions

Threshold value switch 1/0

Outputs at y a logical "1" if $x < S$.

Threshold value switch 0/1

Outputs at y a logical "1" if $x > S$.

Threshold value 1/0 with hysteresis

Outputs a logical "1" at y if $x < S$.
If $x \geq S + H$ then y returns to 0.

Threshold value 0/1 with hysteresis

Outputs a logical "1" at y if $x > S$.
If $x \leq S - H$ then y returns to 0.

Limiter

x is limited to the upper limit LU and the lower limit LL and output at y.
The digital signals MLU and MLL have the value "1", if the upper or lower limit is active.

Sample & Hold element

Sample and hold element.
 $y = x$ if SET = 1

OR element

Exclusive-OR/XOR

$y = 1$ when $x_1 \neq x_2$ is.

Comparator

$y = 1$ when $x_1 = x_2$ is.

R/S flip-flop

S = setting input
R = reset input
Q = non-inverted output
Q-bar = inverted output

Symbols for computational and closed-loop control functions

Sign reversal

$y = -x$

Absolute value generator

$y = |x|$

Divider

$y = \frac{x_1}{x_2}$

Multiplier

$y = x_1 \cdot x_2$

Comparator greater than 0

$y = 1$, if the analog signal $x > 0$, i.e. is positive.

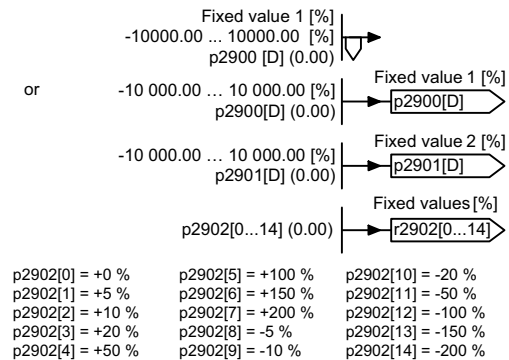

Differentiator

$y = \frac{dx}{dt}$

Pre-assigned connectors and binectors

Handling BICO technology

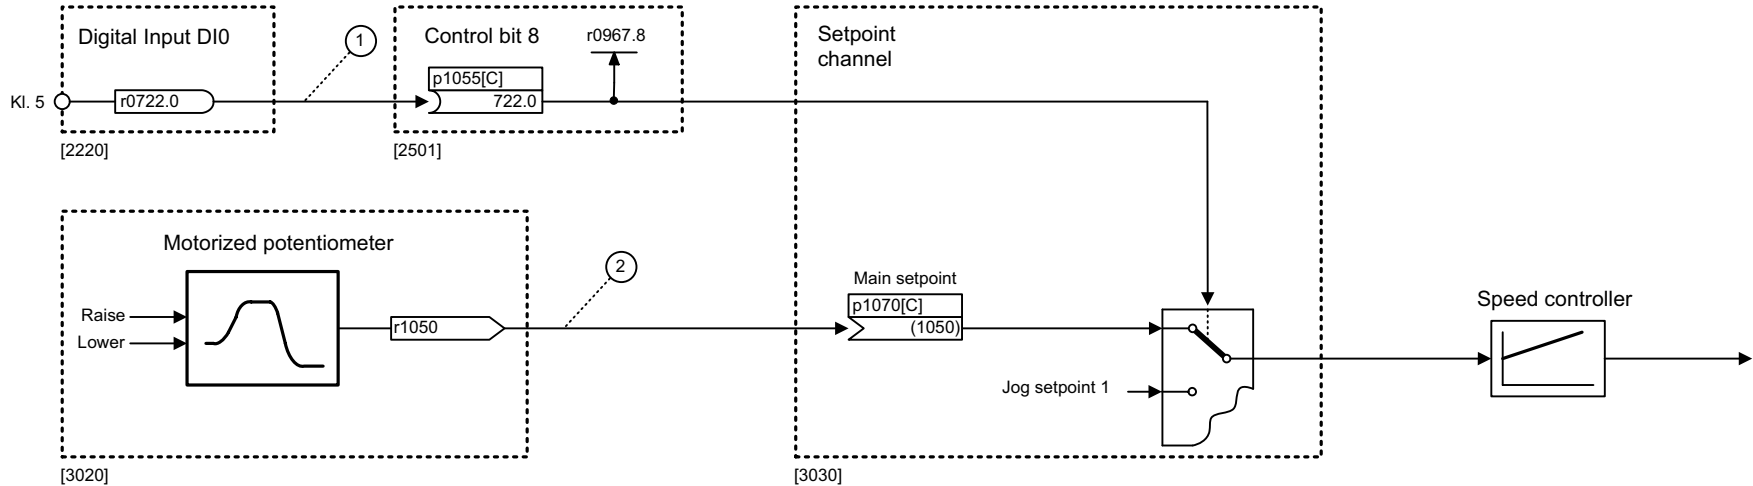

Binector: Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

Connector: Connectors are "analog signals" that can be freely interconnected (e.g. percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

Parameterization:
At the signal destination, the required binector or connector is selected using appropriate parameters:
"BI:" parameter for binectors (BI = Binector Input)
or
"CI:" parameter for connectors (CI = Connector Input)

Example:

The main setpoint for the speed controller (CI: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (BI: p1055) from Digital Input DI0 (BO: r0722.0, Terminal 5 (Kl. 5)) on the CU.

- Parameterizing steps:**
- 1 p1055[0] = 722.0 Terminal 5 (Kl. 5) acts as "Jog bit 0".
 - 2 p1070[0] = 1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

4.1 Overview of faults and alarms

4.1.1 General

Display of faults/alarms (messages)

In the case of a fault, the drive signals the corresponding fault(s) and/or alarm(s).

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET
- Display online via the commissioning software
- Display and operating unit (e.g. BOP, AOP)

Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

Type	Description
Faults	<p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> • The appropriate fault response is triggered. • Status signal ZSW1.3 is set. • The fault is entered in the fault buffer. <p>How are faults eliminated?</p> <ul style="list-style-type: none"> • Remove the original cause of the fault. • Acknowledge the fault.
Alarms	<p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> • Status signal ZSW1.7 is set. • The alarm is entered into the alarm buffer. <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> • Alarms acknowledge themselves. If the cause of the alarm is no longer present, they automatically reset themselves.

Fault reactions

The following fault reactions are defined:

Table 4-2 Fault reactions

List	PROFIdrive	Reaction	Description
NONE	-	None	<p>No response when a fault occurs.</p> <p>Note</p> <p>With "Basic positioner" (r0108.4 = 1), the following applies: When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.</p>
OFF1	ON/ OFF	Brake along the ramp-function generator down ramp followed by pulse inhibit	<p>Closed loop speed control (p1300 = 20, 21)</p> <ul style="list-style-type: none"> • n_set = 0 is input immediately to brake the drive along the ramp-function generator ramp down (p1121). • When zero speed is detected, the motor holding brake (if parameterized) is closed (p1215). The pulses are suppressed when the brake application time (p1217) expires. <p>Zero speed is detected if the actual speed drops below the threshold in p1226 or if the monitoring time (p1227) started when speed setpoint ≤ speed threshold (p1226) has expired.</p> <p>Torque control (p1300 = 22, 23)</p> <ul style="list-style-type: none"> • The following applies for closed-loop torque control: Reaction as for OFF2. • When the system switches to closed-loop torque control with p1501, the following applies: No separate braking reaction. <p>If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake application time (p1217) expires.</p>
OFF1_ DELAYED	-	As for OFF1, however delayed	<p>Faults with this fault response only become effective after the delay time in p3136 has expired.</p> <p>The remaining time up to OFF1 is displayed in r3137.</p>

Table 4-2 Fault reactions, continued

List	PROFIdrive	Reaction	Description
OFF2	COAST STOP	Internal/external pulse disable	Closed-loop speed and torque control <ul style="list-style-type: none"> Instantaneous pulse suppression, the drive "coasts" to a standstill. The motor holding brake (if one is being used) is closed immediately. Switching-on inhibited is activated.
OFF3	QUICK STOP	Brake along the OFF3 down ramp followed by pulse disable	Closed loop speed control (p1300 = 20, 21) <ul style="list-style-type: none"> n_set = 0 is input immediately to brake the drive along the OFF3 ramp down (p1135). When zero speed is detected, the motor holding brake (if parameterized) is closed. The pulses are suppressed when the holding brake's closing time (p1217) expires. Zero speed is detected if the actual speed drops below the threshold in p1226 or if the monitoring time (p1227) started when speed setpoint ≤ speed threshold (p1226) has expired. Switching-on inhibited is activated. Torque control (p1300 = 22, 23) <ul style="list-style-type: none"> Changeover to speed-controlled operation and other reactions as described for speed-controlled operation.
STOP2	-	n_set = 0	<ul style="list-style-type: none"> n_set = 0 is input immediately to brake the drive along the OFF3 ramp down (p1135). The drive remains in closed-loop speed control.
IASC/ DCBRAKE	-	-	<ul style="list-style-type: none"> For synchronous motors, the following applies: If a fault occurs with this fault reaction, an internal armature short-circuit is triggered. The conditions for p1231 = 4 must be observed. For induction motors, the following applies: If a fault occurs with this fault reaction, DC braking is triggered. DC braking must have been commissioned (p1230 to p1239).

Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been eliminated.

Table 4-3 Acknowledging faults

Acknowledgment	Description						
POWER ON	<p>The fault is acknowledged by a POWER ON (switch drive unit off and on again).</p> <p>Note If this action has not removed the fault cause, the fault is displayed again immediately after power up.</p>						
IMMEDIATELY	<p>Faults can be acknowledged on one drive object (Points 1 to 3) or on all drive objects (Point 4) as follows:</p> <p>1 Set acknowledgment by parameter: p3981 = 0 --> 1</p> <p>2 Acknowledging via binector inputs:</p> <table border="0"> <tr> <td>p2103</td> <td>BI: 1. PULSE SUPPRESSION	<p>The fault can only be acknowledged when the pulses are inhibited (r0899.11 = 0).</p> <p>The same options are available for acknowledging as described under IMMEDIATE acknowledgment.</p>						

4.1.2 Explanation of the list of faults and alarms

The data in the following example have been chosen at random. The information listed below is the maximum amount of information that a description can contain. Some of the information is optional.

The "List of faults and alarms" (Page 775) has the following layout:

----- **Start of example** -----

Axxxxx (F, N)	Fault location (optional): Name
Message class:	Text of the message class (number according to PROFIdrive)
Reaction:	NONE
Acknowledgement:	NONE
Cause:	Description of possible causes. Fault value (r0949, interpret format): or alarm value (r2124, interpret format): (optional) Information about fault or alarm values (optional).
Remedy:	Description of possible remedies.

----- **End of example** -----

Axxxxx	Alarm xxxxx
Axxxxx (F, N)	Alarm xxxxx (message type can be changed to F or N)
Fxxxxx	Fault xxxxx
Fxxxxx (A, N)	Fault xxxxx (report type can be changed to A or N)
Nxxxxx	No message
Nxxxxx (A)	No message (message type can be changed to A)
Cxxxxx	Safety message (separate message buffer)

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm"
- F means "Fault"
- N means "No message" or "Internal message"
- C means "Safety message"

The optional brackets indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information on reaction and acknowledgment is specified independently for a message with an adjustable message type (e.g. reaction to F, acknowledgment for F).

Note

You can change the default properties of a fault or alarm by setting parameters.

References: /BA6/ SINAMICS G120 Operating Instructions
Frequency Converter with CU240B/E-2 Control Units,
Section "Alarms, faults, and system messages"

The "List of faults and alarms" (Page 775) supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

Fault location (optional): Name

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

Message class:

For each message, specifies the associated message class with the following structure:

Text of the message class (number according to PROFIdrive)

The message classes are transferred at different interfaces to higher-level control systems and their associated display and operating units.

The message classes that are available are shown in Table "Message classes and coding of various diagnostic interfaces" (Page 770). In addition to the text of the message class and their number according to PROFIdrive – as well as a brief help text regarding the cause and remedy – they also include information about the various diagnostic interfaces:

- PN (hex)
Specifies the "Channel error type" of the PROFINET channel diagnostics.
When activating the channel diagnostics, using the GSDML file, the texts listed in the table can be displayed.
- DS1 (dec)
Specifies the bit number in data set DS1 of the diagnostic alarm for SIMATIC S7.
When the diagnostic alarms are activated, the texts listed in the table can be displayed.
- DP (dec)
Specifies the "Error type" of the channel-related diagnostics for PROFIBUS.
When the channel diagnostics are activated, the texts listed in the standard and the GSD file can be displayed.
- ET 200 (dec)
Specifies the "Error type" of the channel-related diagnostics for the SIMATIC ET 200pro FC-2 device.
When the channel diagnostics are activated, the texts listed in the standard and the GSD file of the ET 200pro can be displayed.
- NAMUR (r3113.x)
Specifies the bit number in parameter r3113.

For the interfaces DP, ET 200, NAMUR, in some instances, the message classes are combined.

Supply voltage fault (3) An electronics supply voltage fault (48 V, 24 V, 5 V ...) was detected. Check the wiring. Check the voltage level.	9002	2	2 ¹ 3 ²	2 ¹ 3 ²	15
DC-link overvoltage (4) The DC-link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings.	9003	3	18	24	2
Power electronics fault (5) An impermissible operating state of the power electronics was detected (overcurrent, overtemperature, IGBT failure ...). Check compliance with the permissible load cycles. Check the ambient temperatures (fan).	9004	4	19	24	3
Overtemperature of the electronic component (6) The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet ventilation.	9005	5	20	5	4
Ground fault / inter-phase short-circuit detected (7) A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cables (connection). Check the motor.	9006	6	21	20	5
Motor overload (8) The motor was operated outside the permissible limits (temperature, current, torque ...). Check the load cycles and set limits. Check the ambient temperature / motor cooling.	9007	7	22	24	6
Communication to the higher-level controller faulted (9) The communication to the higher-level controller (internal coupling, PROFIBUS, PROFINET ...) is faulted or interrupted. Check the state of the higher-level controller. Check the communication connection/-wiring. Check the bus configuration/cycles.	9008	8	23	19	7
Safety monitoring channel has detected an error (10) A safe operation monitoring function has detected an error.	9009	9	24	25	8
Actual position/speed value incorrect or not available (11) An illegal signal state was detected while evaluating the encoder signals (track signals, zero marks, absolute values ...). Check the encoder / state of the encoder signals. Observe the maximum permissible frequencies.	900A	10	25	29	9

Internal (DRIVE-CLiQ) communication faulted (12) The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant installation. Observe the maximum permissible quantity structures / cycles.	900B	11	26	31	10
Infeed fault (13) The infeed is faulty or has failed. Check the infeed and its environment (line supply, filters, reactors, fuses ...). Check the infeed control.	900C	12	27	24	11
Braking controller / Braking Module faulted (14) The internal or external Braking Module is faulted or overloaded (temperature). Check the connection/state of the Braking Module. Comply with the permissible number of braking operations and their duration.	900D	13	28	24	15
Line filter fault (15) The line filter monitoring has detected an excessively high temperature or another impermissible state. Check the temperature / temperature monitoring. Check the configuration to ensure that it is permissible (filter type, infeed, thresholds).	900E	14	17	24	15
External measured value / signal state outside of the permissible range (16) A measured value / signal state read in via the input area (digital/analog/temperature) has assumed an impermissible value/state. Identify and check the relevant signal. Check the set thresholds.	900F	15	29	26	15
Application / technological function faulty (17) The application / technological function has exceeded a (set) limit (position, velocity, torque ...). Identify and check the relevant limit. Check the setpoint specification of the higher-level controller.	9010	16	30	9	15
Error in the parameterization/configuration/commissioning procedure (18) An error was identified in the parameterization or in a commissioning procedure, or the parameterization does not match the actual device configuration. Determine the precise cause of the fault using the commissioning tool. Adapt the parameterization or device configuration.	9011	17	31	16	15
General drive fault (19) Group fault. Determine the precise cause of the fault using the commissioning tool.	9012	18	9	9	15
Auxiliary unit fault (20) The monitoring of an auxiliary unit (incoming transformer, cooling unit ...) has detected an illegal state. Determine the exact cause of the fault and check the relevant device.	9013	19	29	26	15

1. Undervoltage condition of the electronics power supply

2. Overvoltage condition of the electronics power supply

Reaction: Default fault reaction (adjustable fault reaction)

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

Note

See Table "Fault reactions" (Page 765)

Acknowledgment: Default acknowledgment (adjustable acknowledgment)

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

Note

See Table "Acknowledging faults" (Page 767)

Cause:

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0...63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0...7] and specifies additional, more precise information about an alarm.

Remedy:

Describes the methods available for eliminating the cause of the active fault or alarm.

 WARNING
On a case for case basis, service and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

4.1.3 Number ranges of faults and alarms

Note

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in "List of faults and alarms" (Page 775).

Faults and alarms are organized into the following number ranges:

Table 4-5 Number ranges of faults and alarms

of	To	Area
1000	3999	Control Unit
4000	4999	Reserved
5000	5999	Power section

F01000	Internal software error
Message class:	Hardware/software error (1)
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	An internal software error has occurred. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	<ul style="list-style-type: none">- evaluate fault buffer (r0945).- carry out a POWER ON (switch-off/switch-on) for all components.- if required, check the data on the non-volatile memory (e.g. memory card).- upgrade firmware to later version.- contact Technical Support.- replace the Control Unit.
F01001	FloatingPoint exception
Message class:	Hardware/software error (1)
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	An exception occurred during an operation with the FloatingPoint data type. The error may be caused by the basic system or an OA application (e.g., FBLOCKS, DCC). Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting. Note: Refer to r9999 for further information about this fault. r9999[0]: Fault number. r9999[1]: Program counter at the time when the exception occurred. r9999[2]: Cause of the FloatingPoint exception. Bit 0 = 1: Operation invalid Bit 1 = 1: Division by zero Bit 2 = 1: Overflow Bit 3 = 1: Underflow Bit 4 = 1: Inaccurate result
Remedy:	<ul style="list-style-type: none">- carry out a POWER ON (switch-off/switch-on) for all components.- check configuration and signals of the blocks in FBLOCKS.- check configuration and signals of DCC charts.- upgrade firmware to later version.- contact Technical Support.
F01002	Internal software error
Message class:	Hardware/software error (1)
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	An internal software error has occurred. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	<ul style="list-style-type: none">- carry out a POWER ON (switch-off/switch-on) for all components.- upgrade firmware to later version.- contact Technical Support.

F01003	Acknowledgment delay when accessing the memory
Message class:	Hardware/software error (1)
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	A memory area was accessed that does not return a "READY". Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	- carry out a POWER ON (switch-off/switch-on) for all components. - contact Technical Support.
N01004 (F, A)	Internal software error
Message class:	Hardware/software error (1)
Reaction:	NONE
Acknowledge:	NONE
Cause:	An internal software error has occurred. Fault value (r0949, hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	- read out diagnostics parameter (r9999). - contact Technical Support. See also: r9999 (Software error internal supplementary diagnostics)
F01005	File upload/download error
Message class:	Hardware/software error (1)
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The upload or download of EEPROM data was unsuccessful. Fault value (r0949, interpret hexadecimal): yyxxxx hex: yy = component number, xxxx = fault cause xxxx = 000B hex = 11 dec: Power unit component has detected a checksum error. xxxx = 000F hex = 15 dec: The selected power unit will not accept the content of the EEPROM file. xxxx = 0011 hex = 17 dec: Power unit component has detected an internal access error. xxxx = 0012 hex = 18 dec: After several communication attempts, no response from the power unit component. xxxx = 008B hex = 140 dec: EEPROM file for the power unit component not available on the memory card. xxxx = 008D hex = 141 dec: An inconsistent length of the firmware file was signaled. Remedy:	Save a suitable firmware file or EEPROM file for upload or download in folder "/ee_sac/" on the memory card.

A01009 (N)	CU: Control module overtemperature
Message class:	Overtemperature of the electronic components (6)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The temperature (r0037[0]) of the control module (Control Unit) has exceeded the specified limit value.
Remedy:	<ul style="list-style-type: none">- check the air intake for the Control Unit.- check the Control Unit fan. <p>Note:</p> <p>The alarm is automatically withdrawn once the limit value has been fallen below.</p>

F01010	Drive type unknown
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	An unknown drive type was found.
Remedy:	<ul style="list-style-type: none">- replace Power Module.- carry out a POWER ON (switch-off/switch-on).- upgrade firmware to later version.- contact Technical Support.

F01015	Internal software error
Message class:	Hardware/software error (1)
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	<p>An internal software error has occurred.</p> <p>Fault value (r0949, interpret decimal):</p> <p>Only for internal Siemens troubleshooting.</p>

A01016 (F)	Firmware changed
Message class:	Hardware/software error (1)
Reaction:	NONE
Acknowledge:	NONE
Cause:	<p>At least one firmware file in the directory was illegally changed on the non-volatile memory (memory card/device memory) with respect to the version when shipped from the factory.</p> <p>Alarm value (r2124, interpret decimal):</p> <p>0: Checksum of one file is incorrect.</p> <p>1: File missing.</p> <p>2: Too many files.</p> <p>3: Incorrect firmware version.</p> <p>4: Incorrect checksum of the back-up file.</p>
Remedy:	<p>For the non-volatile memory for the firmware (memory card/device memory), restore the delivery condition.</p> <p>Note:</p> <p>The file involved can be read out using parameter r9925.</p> <p>The status of the firmware check is displayed using r9926.</p> <p>See also: r9925 (Firmware file incorrect), r9926 (Firmware check status)</p>

A01017 Component lists changed

Message class: Hardware/software error (1)

Reaction: NONE

Acknowledge: NONE

Cause: On the memory card, one file in the directory /SIEMENS/SINAMICS/DATA or /ADDON/SINAMICS/DATA has been illegally changed with respect to that supplied from the factory. No changes are permitted in this directory.

Alarm value (r2124, interpret decimal):

zyx dec: x = Problem, y = Directory, z = File name

x = 1: File does not exist.

x = 2: Firmware version of the file does not match the software version.

x = 3: File checksum is incorrect.

y = 0: Directory /SIEMENS/SINAMICS/DATA/

y = 1: Directory /ADDON/SINAMICS/DATA/

z = 0: File MOTARM.ACX

z = 1: File MOTSRM.ACX

z = 2: File MOTSLM.ACX

z = 3: File ENCDATA.ACX

z = 4: File FILTDATA.ACX

z = 5: File BRKDATA.ACX

z = 6: File DAT_BEAR.ACX

z = 7: File CFG_BEAR.ACX

Remedy: For the file on the memory card involved, restore the status originally supplied from the factory.

F01018 Booting has been interrupted several times

Message class: Hardware/software error (1)

Reaction: NONE

Acknowledge: POWER ON

Cause: Module booting was interrupted several times. As a consequence, the module boots with the factory setting.

Possible reasons for booting being interrupted:

- power supply interrupted.

- CPU crashed.

- parameterization invalid.

Remedy: - carry out a POWER ON (switch-off/switch-on). After switching on, the module reboots from the valid parameterization (if available).

- restore the valid parameterization.

Examples:

a) Carry out a first commissioning, save, carry out a POWER ON (switch-off/switch-on).

b) Load another valid parameter backup (e.g. from the memory card), save, carry out a POWER ON (switch-off/switch-on).

Note:

If the fault situation is repeated, then this fault is again output after several interrupted boots.

A01019 Writing to the removable data medium unsuccessful

Message class: Hardware/software error (1)

Reaction: NONE

Acknowledge: NONE

Cause: The write access to the removable data medium was unsuccessful.

Remedy: Remove and check the removable data medium. Then run the data backup again.

A01020	Writing to RAM disk unsuccessful
Message class:	Hardware/software error (1)
Reaction:	NONE
Acknowledge:	NONE
Cause:	A write access to the internal RAM disk was unsuccessful.
Remedy:	Adapt the file size for the system logbook to the internal RAM disk (p9930). See also: p9930 (System logbook activation)
A01021	Removable data medium as USB data storage medium from the PC used
Message class:	General drive fault (19)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The removable data medium is used as USB data storage medium from a PC As a consequence, the drive cannot access the removable data medium. When backing up, the configuration data cannot be saved on the removable data medium. Alarm value (r2124, interpret decimal): 1: The know-how protection as well as the copy protection for the removable data medium is active. Backup is inhibited. 2: The configuration data are only backed up in the Control Unit. See also: r7760 (Write protection/know-how protection status), r9401 (Safely remove memory card status)
Remedy:	De-activate the USB connection to the PC and back up the configuration data. Note: The alarm is automatically canceled when disconnecting the USB connection or when removing the removable data medium. See also: r9401 (Safely remove memory card status)
F01023	Software timeout (internal)
Message class:	Hardware/software error (1)
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	An internal software timeout has occurred. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	- carry out a POWER ON (switch-off/switch-on) for all components. - upgrade firmware to later version. - contact Technical Support.
A01028 (F)	Configuration error
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The parameterization that was downloaded was generated with a different module type (Order No., MLFB).
Remedy:	Save parameters in a non-volatile fashion (p0971 = 1).
F01030	Sign-of-life failure for master control
Message class:	Communication error to the higher-level control system (9)
Reaction:	OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	For active PC master control, no sign-of-life was received within the monitoring time. The master control was returned to the active BICO interconnection.

Remedy: Set the monitoring time higher at the PC or, if required, completely disable the monitoring function.
For the commissioning software, the monitoring time is set as follows:
<Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds.
Notice:
The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails!

F01033 Units changeover: Reference parameter value invalid

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: When changing over the units to the referred representation type, it is not permissible for any of the required reference parameters to be equal to 0.0
Fault value (r0949, parameter):
Reference parameter whose value is 0.0.
See also: p0505 (Selecting the system of units), p0595 (Technological unit selection)
Remedy: Set the value of the reference parameter to a number different than 0.0.
See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004

F01034 Units changeover: Calculation parameter values after reference value change unsuccessful

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The change of a reference parameter meant that for an involved parameter the selected value was not able to be re-calculated in the per unit representation. The change was rejected and the original parameter value restored.
Fault value (r0949, parameter):
Parameter whose value was not able to be re-calculated.
See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004
Remedy:
- Select the value of the reference parameter such that the parameter involved can be calculated in the per unit representation.
- Technology unit selection (p0595) before changing the reference parameter p0596, set p0595 = 1.

A01035 (F) ACX: Parameter back-up file corrupted

Message class: Hardware/software error (1)
Reaction: NONE
Acknowledge: NONE
Cause: When the Control Unit is booted, no complete data set was found from the parameter back-up files. The last time that the parameterization was saved, it was not completely carried out.
It is possible that the backup was interrupted by switching off or withdrawing the memory card.
Alarm value (r2124, interpret hexadecimal):
ddccbbaa hex:
aa = 01 hex:
Power up was realized without data backup. The drive is in the factory setting.
aa = 02 hex:
The last available internal backup data record was loaded. The parameterization must be checked. It is recommended that the parameterization is downloaded again.
aa = 03 hex:
The last available data record from the memory card was loaded. The parameterization must be checked.
aa = 04 hex:
An invalid data backup was loaded from the memory card into the drive. The drive is in the factory setting.
dd, cc, bb:
Only for internal Siemens troubleshooting.
See also: p0971 (Save parameters)
Remedy:
- Download the project again with the commissioning software.
- save all parameters (p0971 = 1 or "copy RAM to ROM").

F01036 (A)	ACX: Parameter back-up file missing
Message class:	Hardware/software error (1)
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	<p>When downloading the device parameterization, a parameter back-up file PSxxxxxyy.ACX associated with a drive object cannot be found.</p> <p>Fault value (r0949, interpret hexadecimal):</p> <p>Byte 1: yyy in the file name PSxxxxxyy.ACX</p> <p>yyy = 000 --> consistency back-up file</p> <p>yyy = 001 ... 062 --> drive object number</p> <p>yyy = 099 --> PROFIBUS parameter back-up file</p> <p>Byte 2, 3, 4:</p> <p>Only for internal Siemens troubleshooting.</p>
Remedy:	<p>If you have saved the project data using the commissioning software, carry out a new download for your project.</p> <p>Save using the function "Copy RAM to ROM" or with p0971 = 1.</p> <p>This means that the parameter files are again completely written into the non-volatile memory.</p> <p>Note:</p> <p>If the project data have not been backed up, then a new first commissioning is required.</p>
F01038 (A)	ACX: Loading the parameter back-up file unsuccessful
Message class:	Hardware/software error (1)
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	<p>An error has occurred when downloading PSxxxxxyy.ACX or PTxxxxxyy.ACX files from the non-volatile memory.</p> <p>Fault value (r0949, interpret hexadecimal):</p> <p>Byte 1: yyy in the file name PSxxxxxyy.ACX</p> <p>yyy = 000 --> consistency back-up file</p> <p>yyy = 001 ... 062 --> drive object number</p> <p>yyy = 099 --> PROFIBUS parameter back-up file</p> <p>Byte 2:</p> <p>255: Incorrect drive object type.</p> <p>254: Topology comparison unsuccessful -> drive object type was not able to be identified.</p> <p>Reasons could be:</p> <ul style="list-style-type: none"> - incorrect component type in the actual topology - Component does not exist in the actual topology. - Component not active. <p>Additional values:</p> <p>Only for internal Siemens troubleshooting.</p> <p>Byte 4, 3:</p> <p>Only for internal Siemens troubleshooting.</p>
Remedy:	<ul style="list-style-type: none"> - if you have saved the project data using the commissioning software, download the project again. Save using the function "Copy RAM to ROM" or with p0971 = 1. This means that the parameter files are again completely written to the non-volatile memory. - replace the memory card or Control Unit.
F01039 (A)	ACX: Writing to the parameter back-up file was unsuccessful
Message class:	Hardware/software error (1)
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	<p>Writing to at least one parameter back-up file PSxxxxxyy.*** in the non-volatile memory was unsuccessful.</p> <ul style="list-style-type: none"> - in the directory /USER/SINAMICS/DATA/ at least one parameter back-up file PSxxxxxyy.*** has the "read only" file attribute and cannot be overwritten. - there is not sufficient free memory space available. - the non-volatile memory is defective and cannot be written to.

Fault value (r0949, interpret hexadecimal):
dcba hex
a = yyy in the file names PSxxxxyy.***
a = 000 --> consistency back-up file
a = 001 ... 062 --> drive object number
a = 099 --> PROFIBUS parameter back-up file
b = xxx in the file names PSxxxxyy.***
b = 000 --> data save started with p0971 = 1
b = 010 --> data save started with p0971 = 10
b = 011 --> data save started with p0971 = 11
b = 012 --> data save started with p0971 = 12
d, c:

Only for internal Siemens troubleshooting.

Remedy:

- check the file attribute of the files (PSxxxxyy.***, Cxxxxyy.***, CCxxxxyy.***) and, if required, change from "read only" to "writeable".
- check the free memory space in the non-volatile memory. Approx. 80 kbyte of free memory space is required for every drive object in the system.
- replace the memory card or Control Unit.

F01040 Save parameter settings and carry out a POWER ON

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF2

Acknowledge: POWER ON

Cause: A parameter has been changed that requires the parameters to be backed up and the Control Unit to be switched OFF and ON again.

Remedy:

- Save parameters (p0971).
- carry out a POWER ON (switch-off/switch-on) for the Control Unit.

F01042 Parameter error during project download

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF2 (NONE, OFF1, OFF3)

Acknowledge: IMMEDIATELY

Cause: An error was detected when downloading a project using the commissioning software (e.g. incorrect parameter value).

For the specified parameter, it was detected that dynamic limits were exceeded that may possibly depend on other parameters.

Fault value (r0949, interpret hexadecimal):

ccbbaaaa hex

aaaa = Parameter

bb = Index

cc = fault cause

0: Parameter number illegal.

1: Parameter value cannot be changed.

2: Lower or upper value limit exceeded.

3: Sub-index incorrect.

4: No array, no sub-index.

5: Data type incorrect.

6: Setting not permitted (only resetting).

7: Descriptive element cannot be changed.

9: Descriptive data not available.

11: No master control.

15: No text array available.

17: Task cannot be executed due to operating state.

20: Illegal value.

21: Response too long.

22: Parameter address illegal.

23: Format illegal.
24: Number of values not consistent.
108: Unit unknown.
Additional values:
Only for internal Siemens troubleshooting.

Remedy:

- enter the correct value in the specified parameter.
- identify the parameter that restricts the limits of the specified parameter.

F01043

Fatal error at project download

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF2 (OFF1, OFF3)

Acknowledge: IMMEDIATELY

Cause: A fatal error was detected when downloading a project using the commissioning software.

Fault value (r0949, interpret decimal):

1: Device status cannot be changed to Device Download (drive object ON?).

2: Incorrect drive object number.

8: Maximum number of drive objects that can be generated exceeded.

11: Error while generating a drive object (global component).

12: Error while generating a drive object (drive component).

13: Unknown drive object type.

14: Drive status cannot be changed to "ready for operation" (r0947 and r0949).

15: Drive status cannot be changed to drive download.

16: Device status cannot be changed to "ready for operation".

18: A new download is only possible if the factory settings are restored for the drive unit.

20: The configuration is inconsistent.

21: Error when accepting the download parameters.

22: SW-internal download error.

100: The download was canceled, because no write requests were received from the commissioning client (e.g. for communication error).

Additional values:

Only for internal Siemens troubleshooting.

Remedy:

- use the current version of the commissioning software.
- modify the offline project and download again (e.g. compare the motor and Power Module in the offline project and on the drive).
- change the drive state (is a drive rotating or is there a message/signal?).
- carefully note any other messages/signals and remove their cause.
- boot from previously saved files (switch-off/switch-on or p0970).

F01044

CU: Descriptive data error

Message class: Hardware/software error (1)

Reaction: OFF2

Acknowledge: POWER ON

Cause: An error was detected when loading the descriptive data saved in the non-volatile memory.

Remedy: Replace the memory card or Control Unit.

A01045

Configuring data invalid

Message class: Hardware/software error (1)

Reaction: NONE

Acknowledge: NONE

Cause: An error was detected when evaluating the parameter files PSxxxxxy.ACX, PTxxxxxy.ACX, CAxxxxxy.ACX, or CCxxxxxy.ACX saved in the non-volatile memory. Because of this, under certain circumstances, several of the saved parameter values were not able to be accepted. Also see r9406 up to r9408.

Alarm value (r2124, interpret hexadecimal):

Only for internal Siemens troubleshooting.

Remedy:

- check the parameters displayed in r9406 up to r9408, and correct these if required.
- Restore the factory setting using (p0970 = 1) and re-load the project into the drive unit.

Then save the parameterization in STARTER using the function "Copy RAM to ROM" or with p0971 = 1. This overwrites the incorrect parameter files in the non-volatile memory – and the alarm is withdrawn.

See also: r9406 (PS file parameter number parameter not transferred), r9407 (PS file parameter index parameter not transferred), r9408 (PS file fault code parameter not transferred)

A01049 It is not possible to write to file

Message class: Hardware/software error (1)

Reaction: NONE

Acknowledge: NONE

Cause: It is not possible to write into a write-protected file (PSxxxxx.acx). The write request was interrupted.
Alarm value (r2124, interpret decimal):
Drive object number.

Remedy: Check whether the "write protected" attribute has been set for the files in the non-volatile memory under .../USER/SINAMICS/DATA/... When required, remove write protection and save again (e.g. set p0971 to 1).

F01054 CU: System limit exceeded

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: At least one system overload has been identified.

Fault value (r0949, interpret decimal):

1: Computing time load too high (r9976[1]).

5: Peak load too high (r9976[5]).

Note:

As long as this fault is present, it is not possible to save the parameters (p0971).

See also: r9976 (System utilization)

Remedy: For fault value = 1, 5:

- reduce the computing time load of the drive unit (r9976[1] and r9976[5]) to under 100 %.
- check the sampling times and adjust if necessary (p0115, p0799, p4099).
- de-activate function modules.
- de-activate drive objects.
- remove drive objects from the target topology.
- note the DRIVE-CLiQ topology rules and if required, change the DRIVE-CLiQ topology.

When using the Drive Control Chart (DCC) or free function blocks (FBLOCKS), the following applies:

- the computing time load of the individual run-time groups on a drive object can be read out in r21005 (DCC) or r20005 (FBLOCKS).
- if necessary, the assignment of the run-time group (p21000, p20000) can be changed in order to increase the sampling time (r21001, r20001).
- if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

A01064 (F) CU: Internal error (CRC)

Message class: Hardware/software error (1)

Reaction: NONE

Acknowledge: NONE

Cause: A checksum error (CRC error) has occurred in the Control Unit program memory

Remedy:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

A01066	Buffer memory: 70% fill level reached or exceeded
Message class:	General drive fault (19)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The non-volatile buffer memory for parameter changes is filled to at least 70%. This can also occur if the buffer memory is active (p0014 = 1) and parameters are continually changed via a fieldbus system.
Remedy:	If required, de-activate and clear the buffer memory (p0014 = 0). If required, clear the buffer memory (p0014 = 2). In the following cases, the entries in the buffer memory are transferred into the ROM and then the buffer memory is cleared: - p0971 = 1 - switch off/switch on the Control Unit See also: p0014 (Buffer memory mode)
A01067	Buffer memory: 100 % fill level reached
Message class:	General drive fault (19)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The non-volatile buffer memory for parameter changes is filled to 100%. All additional parameter changes will no longer be taken into account in the non-volatile buffer memory. However, parameter changes can still be made in the volatile memory (RAM). This can also occur if the buffer memory is active (p0014 = 1) and parameters are continually changed via a fieldbus system.
Remedy:	If required, de-activate and clear the buffer memory (p0014 = 0). If required, clear the buffer memory (p0014 = 2). In the following cases, the entries in the buffer memory are transferred into the ROM and then the buffer memory is cleared: - p0971 = 1 - switch off/switch on the Control Unit See also: p0014 (Buffer memory mode)
F01068	CU: Data memory memory overflow
Message class:	Error in the parameterization / configuration / commissioning procedure (18)

4 Faults and alarms

4.2 List of faults and alarms

- Remedy:**
- insert a memory card with compatible parameter backup and carry out a POWER ON.
 - insert a memory card without parameter backup and carry out a POWER ON.
 - if required, withdraw the memory card and carry out POWER ON.
 - save the parameters (p0971 = 1).

F01072 Memory card restored from the backup copy

Message class: General drive fault (19)

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: The Control Unit was switched-off while writing to the memory card. This is why the visible partition became defective.

After switching on, the data from the non-visible partition (backup copy) were written to the visible partition.

Remedy: Check that the firmware and parameterization is up-to-date.

A01073 (N) POWER ON required for backup copy on memory card

Message class: General drive fault (19)

Reaction: NONE

Acknowledge: NONE

Cause: The parameter assignment on the visible partition of the memory card has changed.

In order that the backup copy on the memory card is updated on the non-visible partition, it is necessary to carry out a POWER ON or hardware reset (p0972) of the Control Unit.

Note:

It is possible that a new POWER ON is requested via this alarm (e.g. after saving with p0971 = 1).

Remedy:

- carry out a POWER ON (switch-off/switch-on) for the Control Unit.
- carry out a hardware reset (RESET button, p0972).

F01105 (A) CU: Insufficient memory

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF1

Acknowledge: POWER ON

Cause: Too many data sets are configured on this Control Unit.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

Remedy: - reduce the number of data sets.

F01107 Save to memory card unsuccessful

Message class: Hardware/software error (1)

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: A data save to the memory card was not able to be successfully carried out.

- Memory card is defective.

- insufficient space on memory card.

Fault value (r0949, interpret decimal):

1: The file on the RAM was not able to be opened.

2: The file on the RAM was not able to be read.

3: A new directory could not be created on the memory card.

4: A new file could not be created on the memory card.

5: A new file could not be written on the memory card.

Remedy:

- try to save again.
- replace the memory card or Control Unit.

F01112	CU: Power unit not permissible
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The connected power unit cannot be used together with this Control Unit. Fault value (r0949, interpret decimal): 1: Power unit is not supported (e.g. PM340).
Remedy:	Replace the power unit that is not permissible by a component that is permissible.
F01120 (A)	Terminal initialization has failed
Message class:	Hardware/software error (1)
Reaction:	OFF1 (OFF2)

F01340	Topology: Too many components on one line
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	For the selected communications clock cycle, too many DRIVE-CLiQ components are connected to one line of the Control Unit.

Fault value (r0949, interpret hexadecimal):

xyy hex: x = fault cause, yy = component number or connection number.

1yy:

The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all read transfers.

2yy:

The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all write transfers.

3yy:

Cyclic communication is fully utilized.

4yy:

The DRIVE-CLiQ cycle starts before the earliest end of the application. An additional dead time must be added to the control. Sign-of-life errors can be expected.

The conditions of operation with a current controller sampling time of 31.25 µs have not been maintained.

5yy:

Internal buffer overflow for net data of a DRIVE-CLiQ connection.

6yy:

Internal buffer overflow for receive data of a DRIVE-CLiQ connection.

7yy:

Internal buffer overflow for send data of a DRIVE-CLiQ connection.

8yy:

The component clock cycles cannot be combined with one another

900:

The lowest common multiple of the clock cycles in the system is too high to be determined.

901:

The lowest common multiple of the clock cycles in the system cannot be generated with the hardware.

Remedy:

- check the DRIVE-CLiQ wiring.

- reduce the number of components on the DRIVE-CLiQ line involved and distribute these to other DRIVE-CLiQ sockets of the Control Unit. This means that communication is uniformly distributed over several lines.

For fault value = 1yy - 4yy in addition:

- increase the sampling times (p0112, p0115, p4099). If necessary, for DCC or FBLOCKS, change the assignment of the run-time group (p21000, p20000) so that the sampling time (r21001, r20001) is increased.

- if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

- reduce the function modules (r0108).

- establish the conditions for operation with a current controller sampling time of 31.25 µs (at the DRIVE-CLiQ line, only operate Motor Modules and Sensor Modules with this sampling time and only use a permitted Sensor Module (e.g. SMC20, this means a 3 at the last position of the order number)).

- For an NX, the corresponding Sensor Module for a possibly existing second measuring system should be connected to a free DRIVE-CLiQ socket of the NX.

For fault value = 8yy in addition:

- check the clock cycles settings (p0112, p0115, p4099). Clock cycles on a DRIVE-CLiQ line must be perfect integer multiples of one another. As clock cycle on a line, all clock cycles of all drive objects in the previously mentioned parameters apply, which have components on the line involved.

For fault value = 9yy in addition:

- check the clock cycles settings (p0112, p0115, p4099). The lower the numerical value difference between two clock cycles, the higher the lowest common multiple. This behavior has a significantly stronger influence, the higher the numerical values of the clock cycles.

Cause:	The requested connector output does not have the correct data type. This interconnection is not established. Fault value (r0949, interpret decimal): Parameter number to which an interconnection should be made (connector output).
Remedy:	Interconnect this connector input with a connector output having a float data type.
F01511 (A)	BICO: Interconnection with different scalings
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values. - the BICO output has different normalized units than the BICO input. - message only for interconnections within a drive object. Example: The BICO output has, as normalized unit, voltage and the BICO input has current. This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input. p2002: contains the reference value for current p2001: contains the reference value for voltage Fault value (r0949, interpret decimal): Parameter number of the BICO input (signal sink).
Remedy:	Not necessary.
F01512	BICO: No scaling available
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	An attempt was made to determine a conversion factor for a scaling that does not exist. Fault value (r0949, interpret decimal): Unit (e.g. corresponding to SPEED) for which an attempt was made to determine a factor.
Remedy:	Apply scaling or check the transfer value.
F01513 (N, A)	BICO: Interconnection cross DO with different scalings
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values. An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different. Example 1: BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input. p2002: contains the reference value for current p2001: contains the reference value for voltage Example 2: BICO output with voltage normalized unit in drive object 1 (DO1), BICO input with voltage normalized unit in drive object 2 (DO2). The reference values for voltage (p2001) of the two drive objects have different values. This means that the factor p2001(DO1)/p2001(DO2) is calculated between the BICO output and the BICO input. p2001: contains the reference value for voltage, drive objects 1, 2 Fault value (r0949, interpret decimal): Parameter number of the BICO input (signal sink).

Remedy: Not necessary.

A01514 (F)	BICO: Error when writing during a reconnect
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	During a reconnect operation (e.g. while booting or downloading - but can also occur in normal operation) a parameter was not able to be written to. Example: When writing to BICO input with double word format (DWORD), in the second index, the memory areas overlap (e.g. p8861). The parameter is then reset to the factory setting. Alarm value (r2124, interpret decimal): Parameter number of the BICO input (signal sink).
Remedy:	Not necessary.

F01515 (A)	BICO: Writing to parameter not permitted as the master control is active
Message class:	Error in the parameterization / configuration / commissioning procedure (18)

Cause:	The selected service/maintenance interval for this motor was reached. Alarm value (r2124, interpret decimal): Motor data set number. See also: p0650 (Actual motor operating hours), p0651 (Motor operating hours maintenance interval)
Remedy:	carry out service/maintenance and reset the service/maintenance interval (p0651).

F01600	SI P1 (CU): STOP A initiated
Message class:	Safety monitoring channel has identified an error (10)
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The drive-integrated "Safety Integrated" function on processor 1 has detected an error and initiated a STOP A. - forced checking procedure (test stop) of the safety switch-off signal path on processor 1 unsuccessful. - subsequent response to fault F01611 (defect in a monitoring channel). Fault value (r0949, interpret decimal): 0: Stop request from processor 2. 1005: - Pulses suppressed although STO not selected and there is no internal STOP A present. - For a Power Module with "STO via terminals at the Power Module" (STO_A/STO_B), these terminals are active (DIP switch to "ON"). However, the "STO via terminals at the Power Module" function has not been enabled (p9601.7 = p9801.7 = 0). 1010: Pulses enabled although STO is selected or an internal STOP A is present. 1011: Internal fault for the pulse enable in the Power Module. 1030: Feedback signal of the safety switch-off signal paths for the "STO via terminals at the Power Module" function different. 9999: Subsequent response to fault F01611.

Remedy:

- select Safe Torque Off and de-select again.
 - carry out a POWER ON (switch-off/switch-on) for all components.
 - replace Power Module involved.
- For fault value = 1005:
- de-activate terminals STO_A/STO_B on the Power Module (set both DIP-switches to "OFF") or enable the "STO via terminals at the Power Module" function.
- For fault value = 1030:
- check the discrepancy time, and if required, increase the value (p9650/p9850).
 - check the STO terminal at the Power Module (contact problems).
- For fault value = 9999:
- carry out diagnostics for fault F01611.

F01611 (A)**SI P1 (CU): Defect in a monitoring channel****Message class:**

Safety monitoring channel has identified an error (10)

Reaction:

NONE (OFF1, OFF2, OFF3)

Acknowledge:

IMMEDIATELY (POWER ON)

Cause:

The drive-integrated "Safety Integrated" function on processor 1 has detected a fault in the crosswise data comparison between the two monitoring channels and has initiated a STOP F.

Fault F01600 (SI P1: STOP A initiated) is output as a consequence of this fault.

Fault value (r0949, interpret decimal):

0: Stop request from the other monitoring channel.

1 ... 999:

Number of the cross-compared data that resulted in this fault. This number is also displayed in r9795.

2: SI enable safety functions (p9601, p9801). Crosswise data comparison is only carried out for the supported bits.

3: SI F-DI changeover discrepancy time (p9650, p9850).

8: SI PROFIsafe address (p9610, p9810).

9: SI debounce time for STO (p9651, p9851).

1000: Watchdog timer has expired.

Within the time of approx. 5 x p9650, alternatively, the following was defined:

- the signal at F-DI continually changed with time intervals less than or equal to the discrepancy time (p9650/p9850).
- via PROFIsafe, STO (also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850).

1001, 1002: Initialization error, change timer / check timer.

1950: Module temperature outside the permissible temperature range.

1951: Module temperature not plausible.

2000: Status of the STO selection for both monitoring channels different.

2001: Feedback signal of safe pulse suppression for both monitoring channels different.

2002: Status of the delay timer SS1 for both monitoring channels different (status of the timer in p9650/p9850).

2003: Status of the STO terminal for both monitoring channels different.

6000 ... 6166:

PROFIsafe fault values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these fault values, the failsafe control signals (failsafe values) are transferred to the safety functions.

6000: An internal software error has occurred (only for internal Siemens troubleshooting).

6064 ... 6071: error when evaluating the F parameter. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.

6064: Destination address and PROFIsafe address are different (F_Dest_Add).

6065: Destination address not valid (F_Dest_Add).

6066: Source address not valid (F_Source_Add).

6067: Watchdog time not valid (F_WD_Time).

6068: Incorrect SIL level (F_SIL).

6069: Incorrect F-CRC length (F_CRC_Length).

6070: Incorrect F parameter version (F_Par_Version).

6071: CRC error for the F parameters (CRC1). The transferred CRC value of the F parameters does not match the value calculated in the PROFIsafe driver.

6072: F parameterization is inconsistent.

6165: A communications error was identified when receiving the PROFIsafe telegram. The fault may also occur if an inconsistent or out-of-date PROFIsafe telegram has been received after switching the Control Unit off and on or after plugging in the PROFIBUS/PROFINET cable.

6166: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

Remedy:

For fault values 1 ... 999 described in "Cause":

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (switch-off/switch-on).

For fault value = 1000:

- check the wiring of the F-DI (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the discrepancy time, and if required, increase the value (p9650/p9850).

For fault value = 1001, 1002:

- carry out a POWER ON (switch-off/switch-on).

For fault value = 1950, 1951:

- Operate the Control Unit in the permissible temperature range.
- replace Control Unit.

For fault value = 2000, 2001, 2002, 2003:

- check the discrepancy time, and if required, increase the value (p9650/p9850).
- check the wiring of the F-DI (contact problems).
- check the causes of the STO selection in r9772. When the SI Motion functions are active (p9501 = 1), STO can also be selected using these functions.

For fault value = 6000:

- carry out a POWER ON (switch-off/switch-on).
- upgrade firmware to later version.
- contact Technical Support.
- replace Control Unit.

For fault value = 6064:

- check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe slave.
- check the setting of the PROFIsafe address on processor 1 (p9610) and on processor 2 (p9810).

For fault value = 6065:

- check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe slave. It is not permissible for the destination address to be either 0 or FFFF!

For fault value = 6066:

- check the setting of the value in the F parameter F_Source_Add at the PROFIsafe slave. It is not permissible for the source address to be either 0 or FFFF!

For fault value = 6067:

- check the setting of the value in the F parameter F_WD_Time at the PROFIsafe slave. It is not permissible for the watch time to be 0!

For fault value = 6068:

- check the setting of the value in the F parameter F_SIL at the PROFIsafe slave. The SIL level must correspond to SIL2!

For fault value = 6069:

- check the setting of the value in the F parameter F_CRC_Length at the PROFIsafe slave. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!

For fault value = 6070:

- check the setting of the value in the F parameter F_Par_Version at the PROFIsafe slave. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!

For fault value = 6071:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and, if required, update.

For fault value = 6072:

- check the settings of the values for the F parameters and, if required, correct.

The following combinations are permissible for F parameters F_CRC_Length and F_Par_Version:

F_CRC_Length = 2-byte CRC and F_Par_Version = 0

F_CRC_Length = 3-byte CRC and F_Par_Version = 1

For fault value = 6165:

- if the fault occurs after powering up or after inserting the PROFIBUS/PROFINET cable, acknowledge the fault.
- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- check whether all F parameters of the drive match the F parameters of the F host.

For fault value = 6166:

- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.
- check whether all F parameters of the drive match the F parameters of the F host.

For fault values that are described in "Cause":

- carry out a POWER ON (switch-off/switch-on).
- contact Technical Support.
- replace Control Unit.

F01649**SI P1 (CU): Internal software error**

Message class: Hardware/software error (1)

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: An internal error in the Safety Integrated software on processor 1 has occurred.

Note:

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret hexadecimal):

Only for internal Siemens troubleshooting.

Remedy:

- carry out a POWER ON (switch-off/switch-on).
- re-commission the "Safety Integrated" function and carry out a POWER ON.
- contact Technical Support.
- replace Control Unit.

F01650**SI P1 (CU): Acceptance test required**

Message class: Safety monitoring channel has identified an error (10)

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The drive-integrated "Safety Integrated" function on processor 1 requires an acceptance test.

Note:

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

130: Safety parameters for processor 2 not available.

Note:

This fault value is always output when Safety Integrated is commissioned for the first time.

1000: Reference and actual checksum on processor 1 are not identical (booting).

- at least one checksum-checked piece of data is defective.

- safety parameters set offline and loaded into the Control Unit.

2000: Reference and actual checksum on processor 1 are not identical (commissioning mode).

- reference checksum incorrectly entered on processor 1 (p9799 not equal to r9798).

- when de-activating the safety functions, p9501 was not deleted.

2001: Reference and actual checksum on processor 2 are not identical (commissioning mode).

- reference checksum incorrectly entered on processor 2 (p9899 not equal to r9898).

- when de-activating the safety functions, p9501 was not deleted.

2002: Enable of safety-related functions between the processor 1 and processor 2 differ (p9601 not equal to p9801).

2003: Acceptance test is required as a safety parameter has been changed.

2004: An acceptance test is required because a project with enabled safety-functions has been downloaded.

2005: The Safety logbook has identified that a functional safety checksum has changed. An acceptance test is required.

2010: Enable of safety-related brake control between the two monitoring channels differ (p9602 not equal to p9802).

2020: Error when saving the safety parameters for the processor 2.

9999: Subsequent response of another safety-related fault that occurred when booting that requires an acceptance test.

Remedy:

For fault value = 130:

- carry out safety commissioning routine.

For fault value = 1000:

- again carry out safety commissioning routine.
- replace the memory card or Control Unit.

- Using STARTER, activate the safety parameters for the drive involved (change settings, copy parameters, activate settings).

For fault value = 2000:

- check the safety parameters on processor 1 and adapt the reference checksum (p9799).

For fault value = 2001:
- check the safety parameters on processor 2 and adapt the reference checksum (p9899).
For fault value = 2002:
- enable the safety-related functions on processor 1 and check processor 2 (p9601 = p9801).
For fault value = 2003, 2004, 2005:
- carry out an acceptance test and generate an acceptance report.
The fault with fault value 2005 can only be acknowledged when the "STO" function is de-selected.
For fault value = 2010:
- check the enable the safety-related brake control on both monitoring channels (p9602 = p9802).
For fault value = 2020:
- again carry out safety commissioning routine.
- replace the memory card or Control Unit.
For fault value = 9999:
- carry out diagnostics for the other safety-related fault that is present.
Note:
STO: Safe Torque Off

F01651	SI P1 (CU): Synchronization safety time slices unsuccessful
Message class:	Hardware/software error (1)
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The "Safety Integrated" function requires synchronization of the safety time slices between processor 1 and processor 2. This synchronization routine was unsuccessful. Note: This fault results in a STOP A that cannot be acknowledged. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	Carry out a POWER ON (switch-off/switch-on).

Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	There is a PROFIBUS/PROFINET configuration error for using Safety Integrated monitoring functions with a higher-level control. Note: For safety functions that have been enabled, this fault results in a STOP A that cannot be acknowledged. Fault value (r0949, interpret decimal): 200: A safety slot for receive data from the control has not been configured. 210, 220: The configured safety slot for the receive data from the control has an unknown format. 230: The configured safety slot for the receive data from the F-PLC has the incorrect length. 231: The configured safety slot for the receive data from the F-PLC has the incorrect length. 250: A PROFIsafe slot is configured in the higher-level F control, however PROFIsafe is not enabled in the drive. 300: A safety slot for the send data to the control has not been configured. 310, 320: The configured safety slot for the send data to the control has an unknown format. 330: The configured safety slot for the send data to the F-PLC has the incorrect length. 331: The configured safety slot for the send data to the F-PLC has the incorrect length.
Remedy:	The following generally applies: - check and, if necessary, correct the PROFIBUS/PROFINET configuration of the safety slot on the master side. - upgrade the Control Unit software. For fault value = 250: - remove the PROFIsafe configuring in the higher-level F control or enable PROFIsafe in the drive. For fault value = 231, 331: - configure the PROFIsafe telegram matching the parameterization in the F-PLC.

The following applies for p9501.30 = 1 (F-DI via PROFIsafe is enabled):

- PROFIsafe telegram 900 must be configured.

For p9501.30 = 0 (F-DI not enabled via PROFIsafe), the following applies:

- PROFIsafe telegram 30 must be configured.

F01692 SI Motion P1 (CU): Parameter value not permitted for encoderless

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: For encoderless motion monitoring functions, the parameter cannot be parameterized with this value.

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

Parameter number with the incorrect value.

See also: p9501 (SI Motion enable safety functions (processor 1))

Remedy: Correct the parameter specified in the fault value.

A01693 (F)	SI P1 (CU): Safety parameter setting changed, POWER ON required
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	Safety parameters have been changed; these will only take effect following a POWER ON. Notice: All changed parameters of the safety motion monitoring functions will only take effect following a POWER ON. Alarm value (r2124, interpret decimal): Parameter number of the safety parameter which has changed, necessitating a POWER ON.
Remedy:	- execute the function "Copy RAM to ROM". - carry out a POWER ON (switch-off/switch-on).
A01696 (F)	SI Motion: Test stop for the motion monitoring functions selected when booting
Message class:	Safety monitoring channel has identified an error (10)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The forced checking procedure (test stop) for the safe motion monitoring functions is already selected when booting, which is not permissible. This is the reason that the test is only carried out again after first selecting the forced checking procedure. Note: This message does not result in a safety stop response. See also: p9705 (SI Motion: Test stop signal source)
Remedy:	De-select the forced checking procedure of the safety motion monitoring functions and then select again. The signal source to select the forced checking procedure is set via binector input p9705. Note: SI: Safety Integrated
A01697 (F)	SI Motion: Test stop for motion monitoring functions required
Message class:	Safety monitoring channel has identified an error (10)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The time set in p9559 for the forced checking procedure (test stop) for the safe motion monitoring functions has been exceeded. A new forced checking procedure is required. After the next time the forced checking procedure is selected, the message is withdrawn and the monitoring time is reset. Note: - this message does not result in a safety stop response. - As the switch-off signal paths are not automatically checked during booting, an alarm is always issued once booting is complete. - the test must be performed within a defined, maximum time interval (p9559, maximum of 9000 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning. See also: p9559 (SI Motion forced checking procedure timer (processor 1)), r9765 (SI Motion forced checking procedure remaining time (processor 1))
Remedy:	Carry out the forced checking procedure of the safety motion monitoring functions. The signal source to select the forced checking procedure is set via binector input p9705. Note: SI: Safety Integrated See also: p9705 (SI Motion: Test stop signal source)

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.

Permissible deviation between the two monitoring channels: p9542/p9342.

6000 ... 6999:

Error in the PROFIsafe control.

For these message values, the failsafe control signals (failsafe values) are transferred to the safety functions.

The significance of the individual message values is described in safety fault F01611.

Message values that have not been listed are only for internal Siemens troubleshooting.

See also: r9725 (SI Motion diagnostics STOP F)

Remedy:

For message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for processor 2: C30711).

For message value = 3:

Commissioning phase:

- check the setting of the gear parameters on both monitoring channels (p9521/p9321, p9522/p9322).
- check the numerator of the gear ratio to ensure that it takes into account the motor pole pair number (p9522/p9322).

In operation:

- increase the ramp-function generator ramp-up/down time (p1120/p1121), reduce the dynamic performance of the drive.

For message value = 1 ... 999:

- if the message value is listed under cause: Check the crosswise-compared parameters to which the message value refers.

- copy the safety parameters.
- carry out a POWER ON (switch-off/switch-on).
- upgrade the Control Unit software.

For message value = 1000:

- investigate the signal associated with the F-DI (contact problems).

For message value = 1001:

- carry out a POWER ON (switch-off/switch-on).
- upgrade the Control Unit software.

For message value = 1005:

- check the conditions for pulse enable.

For message value = 1011:

- for diagnostics, refer to parameter (r9571).

For message value = 1020:

- carry out a POWER ON (switch-off/switch-on).
- replace Control Unit.

For message value = 1041:

- reduce the minimum current (p9588).

For message value = 1042:

- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.
- increase the minimum current (p9588).

For message value = 1043:

- increase the voltage tolerance (p9589).
- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.

For message value = 6000 ... 6999:

Refer to the description of the message values in safety fault F01611.

SI Motion P1 (CU): Defect in F-IO processing

Message class:

Safety monitoring channel has identified an error (10)

Reaction:

NONE

Acknowledge:

IMMEDIATELY (POWER ON)

Cause:

When cross checking and comparing the two monitoring channels, the drive detected a difference between parameters or results of the F-IO processing and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

The safety message C01711 with message value 0 is also displayed due to initiation of STOP F.

If at least one monitoring function is active, then safety message C01701 "SI Motion: STOP B initiated" is output.

Message value (r2124, interpret decimal):

Number of the cross-compared data that resulted in this message.

- 1: SI discrepancy monitoring time inputs (p10002, p10102).
- 2: SI acknowledgment internal event input terminal (p10006, p10106).
- 3: SI STO input terminal (p10022, p10122).
- 4: SI SS1 input terminal (p10023, p10123).
- 7: SI SLS input terminal (p10026, p10126).
- 13: Different states for static inactive signal sources (p10006, p10022 ... p10026).
- 14: SI discrepancy monitoring time outputs (p10002, p10102).
- 15: SI acknowledgment internal event (p10006, p10106).
- 46: SI digital inputs debounce time (p10017, p10117)

C01770	SI Motion P1 (CU): Discrepancy error of the fail-safe inputs
Message class:	Safety monitoring channel has identified an error (10)
Reaction:	NONE
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The fail-safe digital inputs (F-DI) show a different state longer than that parameterized in p10002 / p10102. Fault value (r0949, interpret binary): Bit 0: Discrepancy error for F-DI 0 Bit 1: Discrepancy error for F-DI 1 ...
	Note: If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs.

Remedy:

- check the wiring of the F-DI (contact problems).

Note:

This message can be acknowledged via F-DI or PROFIsafe.

Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10006, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally.

When the "Extended message acknowledgment" function (p9507.0) is active, the following applies:

If the F-DI assigned for STO or SS1 is in a fail-safe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed.

For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency.

If the period of a cyclic switching pulse corresponds to twice the value of p10002, then the following formulas should be checked:

- $p10002 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time)

- $p10002 \geq 12 \text{ ms}$ (discrepancy time must be no less than 12 ms)

- $p10002 > td$ (discrepancy time must be greater than the switch discrepancy time which may actually apply)

td = possible actual discrepancy time (in ms) that can occur with a switching operation. It must be at least 12 ms.

tp = period for a switching operation in ms.

When debounce p10017 is active, the discrepancy time is directly specified by the debounce time.

If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked.

- $p10002 < p10017 + 1 \text{ ms} - td$

- $p10002 > td$

- $p10002 \geq 12 \text{ ms}$

Example:

For a 110 ms switching frequency and $p10017 = 0$, the maximum discrepancy time that can be set is as follows:

$p10002 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$

Rounded off, $p10002 \leq 36 \text{ ms}$ is obtained (as the discrepancy time is rounded off as a multiple of 12 ms).

A01788**SI: Automatic test stop waits for STO deselection via motion monitoring functions****Message class:**

Safety monitoring channel has identified an error (10)

Reaction:

NONE

Acknowledge:

NONE

Cause:

The automatic test stop (forced checking procedure) was not able to be carried out after powering up.

Possible causes:

- the STO function is selected via safe motion monitoring functions.

- a safety message is present, that resulted in a STO.

Note:

STO: Safe Torque Off

Remedy:

- deselect STO via safe motion monitoring functions.

- remove the cause of the safety messages and acknowledge the messages.

Note:

The automatic test stop is performed after removing the cause.

A01790**SI: Power up stopped due to STO via terminals****Message class:**

Safety monitoring channel has identified an error (10)

Reaction:

NONE

Acknowledge:

NONE

Cause:

When powering up, the automatic internal self test of the Control Unit was not able to be completed as the pulses were not enabled. It is possible that the "STO via terminals at the Power Module" function is being used, and STO is selected in at least one hardware switch-off signal path at the Power Module.

Remedy:

- Deselect STO via the STO terminals at the Power Module (connect STO_A and STO_B to 24 V).
- if required, de-activate the "STO via terminals at the Power Module" function via the DIP switch (both DIP switches set to "OFF").

Note:

- After the cause has been removed, the Control Unit continues to power up.
- While the alarm remains, a possibly existing brake is kept closed.

Note:

In this state, the pulses are safely suppressed.

Alarm value (r2124, interpret decimal):

3: Wait for communication to be established to PROFIsafe F-Host.

Remedy: If, after a longer period of time, the message is not automatically withdrawn, the following checks have to be made:

- check any other PROFIsafe communication messages/signals present and evaluate them.
- check the operating state of the F-Host.
- check the communication connection to the F Host.

C01798 SI Motion P1 (CU): Test stop for motion monitoring functions running

Message class: Safety monitoring channel has identified an error (10)

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The forced checking procedure (test stop) for the safe motion monitoring functions is currently in progress.

Remedy: Not necessary.

The message is automatically withdrawn when the test stop has been completed.

Note:

SI: Safety Integrated

C01799 SI Motion P1 (CU): Acceptance test mode active

Message class: Safety monitoring channel has identified an error (10)

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The acceptance test mode is active.

Remedy: Not necessary.

The message is withdrawn when exiting the acceptance test mode.

A01900 (F) PROFIBUS: Configuration telegram error

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: NONE

Cause: A PROFIBUS master attempts to establish a connection using an incorrect configuring telegram.

Alarm value (r2124, interpret decimal):

2: Too many PZD data words for input or output. The number of possible PZD is specified by the number of indices in r2050/p2051.

3: Uneven number of bytes for input or output.

211: Unknown parameterizing block.

501: PROFIsafe parameter error (e.g. F_dest).

502: PROFIsafe telegram does not match.

Additional values:

Only for internal Siemens troubleshooting.

Remedy:

- Check the bus configuration on the master and slave sides.
- For alarm value = 2:
 - Check the number of data words for input and output.
- For alarm value = 211:
 - Ensure offline version <= online version.
- For alarm value = 501:
 - Check the set PROFIsafe address (p9610).
- For alarm value = 502:
 - Check the enable of F-DI (p9501.30).

F01910 (N, A)	Fieldbus interface setpoint timeout
Message class:	Communication error to the higher-level control system (9)

For PROFIBUS: <ul style="list-style-type: none">- PROFIBUS master set into the STOP state. See also: p2040 (Fieldbus interface monitoring time), p2047 (PROFIBUS additional monitoring time)
Remedy:	Ensure bus connection has been established and switch on communication partner. <ul style="list-style-type: none">- if required, adapt p2040. For PROFIBUS: <ul style="list-style-type: none">- set the PROFIBUS master to the RUN state.- if the error is repeated, check the set response monitoring in the bus configuration (HW Config).- slave redundancy: For operation on a Y link, it must be ensured that "DP alarm mode = DPV1" is set in the slave parameterization.

A01920 (F)	PROFIBUS: Interruption cyclic connection
Message class:	Communication error to the higher-level control system (9)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The cyclic connection to the PROFIBUS master is interrupted.
Remedy:	Establish the PROFIBUS connection and activate the PROFIBUS master in the cyclic mode. Note: If there is no communication to a higher-level control system, then p2030 should be set = 0 to suppress this message. See also: p2030 (Field bus int protocol selection)

A01945	PROFIBUS: Connection to the Publisher failed
Message class:	Communication error to the higher-level control system (9)
Reaction:	NONE
Acknowledge:	NONE
Cause:	For PROFIBUS peer-to-peer data transfer, the connection to at least one Publisher has failed. Alarm value (r2124, interpret binary): Bit 0 = 1: Publisher with address in r2077[0], connection failed. ... Bit 15 = 1: Publisher with address in r2077[15], connection failed.
Remedy:	Check the PROFIBUS cables. See also: r2077 (PROFIBUS diagnostics peer-to-peer data transfer addresses)

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause:
- a trigger signal was not specified.
- the specified signal does not exist.
- the specified signal is not a fixed-point signal.
- the specified signal cannot be used as a trigger signal for the trace.
Remedy: Specify a valid trigger signal.

A02063 Trace: Invalid data type

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause: The specified data type to select a signal using a physical address is invalid.
Remedy: Use a valid data type.

A02070 Trace: Parameter cannot be changed

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause: The trace parameter settings cannot be changed when the trace is active.
Remedy:
- stop the trace before parameterization.
- if required, start the trace.

A02075 Trace: Pretrigger time too long

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause: The selected pretrigger time must be shorter than the trace time.
Remedy: Check the pretrigger time setting and change if necessary.

F02080 Trace: Parameterization deleted due to unit changeover

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The trace parameterization in the drive unit was deleted due to a unit changeover or a change in the reference parameters.
Remedy: Restart trace.

A02095 MTrace 0: multiple trace cannot be activated

 - writing the measurement result files to the card is blocked by the parameter save.
- 4: Data save operation canceled.
- for instance, the file required for the data save operation was not able to be found.
- Remedy:**
- insert or remove the memory card.
 - use a larger memory card.
 - configure a longer trace time or use an endless trace.
 - avoid saving parameters while a multiple trace is running.
 - check whether other functions are presently accessing measurement result files.

A02099	Trace: Insufficient Control Unit memory
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The memory space still available on the Control Unit is no longer sufficient for the trace function.
Remedy:	Reduce the memory required, e.g. as follows: <ul style="list-style-type: none"> - reduce the trace time. - increase the trace clock cycle. - reduce the number of signals to be traced.

A02150	OA: Application cannot be loaded
Message class:	Hardware/software error (1)
Reaction:	NONE

Fault value (r0949, interpret hexadecimal): yyxx hex: yy = fault cause, xx = application ID yy = 1: The action p7770 = 1 is not supported by this version if Drive Control Chart (DCC) is activated for the drive object concerned. yy = 2: The data length of the specified application is not the same in the NVRAM and the backup. yy = 3: The data checksum in p7774 is not correct. yy = 4: No data available to load.
Remedy:	- Perform the remedy according to the results of the troubleshooting. - if necessary, start the action again.
F03001	NVRAM checksum incorrect
Message class:	Hardware/software error (1)
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	A checksum error occurred when evaluating the non-volatile data (NVRAM) on the Control Unit. The NVRAM data affected was deleted.
Remedy:	Carry out a POWER ON (switch-off/switch-on) for all components.
F03505 (N, A)	Analog input wire breakage
Message class:	External measured value / signal state outside the permissible range (16)
Reaction:	OFF1 (NONE, OFF2)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The wire-break monitoring for an analog input has responded. The input value of the analog input has undershot the threshold value parameterized in p0761[0...3]. p0756[0]: analog input 0 (only CU240D-2) p0756[1]: analog input 1 (only CU240D-2) Fault value (r0949, interpret decimal): yyyy dec y = analog input (0 = analog input 0 (AI 0), 1 = analog input 1 (AI 1)) xxx = component number (p0151)

Note:

For the following analog input type, the wire breakage monitoring is active:

p0756[0...1] = 1 (2 ... 10 V with monitoring)

Remedy:

- check the connection to the signal source for interruptions.
- check the magnitude of the injected current - it is possible that the infed signal is too low.

Note:

The input current measured by the analog input can be read in r0752[x].

A03510 (F, N)

Calibration data not plausible

Message class: Hardware/software error (1)

Reaction: NONE

Acknowledge: NONE

Cause: During booting, the calibration data for the analog inputs is read and checked with respect to plausibility. At least one calibration data point was determined to be invalid.

Remedy: - switch off/switch on the power supply for the Control Unit.

Note:

If it reoccurs, then replace the module.

In principle, operation could continue.

The analog channel involved possibly does not achieve the specified accuracy.

A05000 (N)

Power unit: Overtemperature heat sink AC inverter

Message class: Power electronics faulted (5)

Reaction: NONE

Acknowledge: NONE

Cause: The alarm threshold for overtemperature at the inverter heat sink has been reached. The response is set using p0290.

If the temperature of the heat sink increases by an additional 5 K, then fault F30004 is initiated.

Remedy: Check the following:

- is the ambient temperature within the defined limit values?
- have the load conditions and the load duty cycle been appropriately dimensioned?
- has the cooling failed?

A05001 (N)

Power unit: Overtemperature depletion layer chip

Message class: Power electronics faulted (5)

Reaction: NONE

Acknowledge: NONE

Cause: Alarm threshold for overtemperature of the power semiconductor in the AC converter has been reached.

Note:

- the response is set using p0290.

- if the depletion layer temperature increases by an additional 15 K, then fault F30025 is triggered.

Remedy: Check the following:

- is the ambient temperature within the defined limit values?
- have the load conditions and the load duty cycle been appropriately dimensioned?
- has the cooling failed?
- pulse frequency too high?

A05002 (N)

Power unit: Air intake overtemperature

Message class: Power electronics faulted (5)

Reaction: NONE

Acknowledge: NONE

Cause: For chassis power units, the following applies:

The alarm threshold for the air intake overtemperature has been reached. For air-cooled power units, the threshold is 42 °C (hysteresis 2 K). The response is set using p0290.

If the air intake temperature increases by an additional 13 K, then fault F30035 is output.

4 Faults and alarms

4.2 List of faults and alarms

Remedy: Check the following:

- is the ambient temperature within the defined limit values?
- has the fan failed? Check the direction of rotation.

A05004 (N) Power unit: Rectifier overtemperature

Message class: Power electronics faulted (5)

Reaction: NONE

Acknowledge: NONE

Cause: The alarm threshold for the overtemperature of the rectifier has been reached. The response is set using p0290. If the temperature of the rectifier increases by an additional 5 K, then fault F30037 is triggered.

Remedy: Check the following:

- is the ambient temperature within the defined limit values?
- have the load conditions and the load duty cycle been appropriately dimensioned?
- has the fan failed? Check the direction of rotation.
- has a phase of the line supply failed?
- is an arm of the supply (incoming) rectifier defective?

A05006 (N) Power unit: Overtemperature thermal model

Message class: Power electronics faulted (5)

Reaction: NONE

Acknowledge: NONE

Cause: The temperature difference between the chip and heat sink has exceeded the permissible limit value (blocksize power units only).

Depending on p0290, an appropriate overload response is initiated.

See also: r0037 (Power unit temperatures)

Remedy: Not necessary.

The alarm disappears automatically once the limit value is undershot.

Note:

If the alarm does not disappear automatically and the temperature continues to rise, this can result in fault F30024.

See also: p0290 (Power unit overload response)

A05065 (F, N) Voltage measured values not plausible

Message class: Power electronics faulted (5)

Reaction: NONE

Acknowledge: NONE

Cause: The voltage measurement does not supply any plausible values and is not used.

Alarm value (r2124, interpret bitwise binary):

Bit 1: Phase U

Bit 2: Phase V

Bit 3: Phase W

Remedy: The following parameterization must be made in order to de-activate the alarm:

- De-activate voltage measurement (p0247.0 = 0).

- De-activate flying restart with voltage measurement (p0247.5 = 0) and de-activate fast flying restart (p1780.11 = 0).

F06310 (A) Supply voltage (p0210) incorrectly parameterized

Message class: Network fault (2)

Reaction: NONE (OFF1, OFF2)

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The measured DC voltage lies outside the tolerance range after precharging has been completed.

Permissible range:

$1.16 \cdot p0210 < r0070 < 1.6 \cdot p0210$

Note:

The fault can only be acknowledged when the drive is switched off.

See also: p0210 (Drive unit line supply voltage)

Remedy:

- check the parameterized supply voltage and if required change (p0210).
- check the line supply voltage.

See also: p0210 (Drive unit line supply voltage)

A06921 (N) Braking resistor phase unsymmetry

Message class: Braking Module faulted (14)
Reaction: NONE
Acknowledge: NONE
Cause:

- the three resistors of the braking chopper are not symmetrical.
- DC link voltage oscillations caused by fluctuating loads of the connected drives.

Remedy:

- check the feeder cables to the braking resistors.
- if required, increase the value for detecting dissymmetry (p1364).

F06922 Braking resistor phase failure

Message class: Braking Module faulted (14)
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: A phase failure for the brake resistor was detected.
 Fault value (r0949, interpret decimal):
 11: Phase U
 12: Phase V
 13: Phase W
 See also: p3235 (Phase failure signal motor monitoring time)
Remedy: Check the feeder cables to the braking resistors.

F07011 Drive: Motor overtemperature

Message class: Motor overload (8)
Reaction: OFF2 (NONE, OFF1, OFF3, STOP2)
Acknowledge: IMMEDIATELY
Cause: KTY84/PT1000:
 The motor temperature has exceeded the fault threshold (p0605) or the timer (p0606) after the alarm threshold was exceeded (p0604) has expired. The response parameterized in p0610 becomes active. The alarm is withdrawn if the response threshold for wire breakage or sensor not connected is exceeded (R > 2120 Ohm).
 PTC or bimetallic NC contact:
 The response threshold of 1650 Ohm was exceeded or the NC contact opened and the timer (p0606) has expired. The response parameterized in p0610 becomes active.
 Possible causes:

- motor is overloaded.
- motor ambient temperature too high.
- wire breakage or sensor not connected.

 Fault value (r0949, interpret decimal):
 200:
 The motor temperature model 1 (I2t) signals an overtemperature (p0612.0 = 1, p0611 > 0, p0615 reached).
 See also: p0604, p0605, p0606, p0612, p0613, p0625, p0626, p0627, p0628
Remedy:

- reduce the motor load.
- check the ambient temperature and the motor ventilation.
- check the wiring and the connection of the PTC or bimetallic NC contact.

Remedy:

- check the motor load and if required, reduce.
- check the motor ambient temperature.
- check activation of the motor temperature model (p0612).

Motor temperature model 1 (I2t):

- check the thermal time constant (p0611).
- check the alarm threshold (p0605).

Motor temperature model 3:

- check the motor type.
- check the alarm threshold (p5398).
- check the model parameters.

A07014 (N) Drive: Motor temperature model configuration alarm

Message class: Motor overload (8)

Reaction: NONE

Acknowledge: NONE

Cause: A fault has occurred in the configuration of the motor temperature model.

Alarm value (r2124, interpret decimal):

1:

All motor temperature models: It is not possible to save the model temperature

See also: p0610 (Motor overtemperature response)

Remedy: - set the response for motor overtemperature to "Alarm and fault, no reduction of I_{max}" (p0610 = 2).

See also: p0610 (Motor overtemperature response)

A07015 Drive: Motor temperature sensor alarm

Message class: External measured value / signal state outside the permissible range (16)

Reaction: NONE

Acknowledge: NONE

Cause: An error was detected when evaluating the temperature sensor set in p0601.

With the fault, the time in p0607 is started. If the fault is still present after this time has expired, then fault F07016 is output; however, at the earliest, 50 ms after alarm A07015.

Possible causes:

- wire breakage or sensor not connected (KTY: R > 2120 Ohm, PT1000: R > 2120 Ohm).
- measured resistance too low (PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT1000: R < 603 Ohm).

Remedy: - make sure that the sensor is connected correctly.

- check the parameterization (p0601).

F07016 Drive: Motor temperature sensor fault

Message class: External measured value / signal state outside the permissible range (16)

Reaction: OFF1 (NONE, OFF2, OFF3, STOP2)

Acknowledge: IMMEDIATELY

Cause: An error was detected when evaluating the temperature sensor set in p0601.

Possible causes:

- wire breakage or sensor not connected (KTY: R > 2120 Ohm, PT1000: R > 2120 Ohm).
- measured resistance too low (PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT1000: R < 603 Ohm).

Note:

If alarm A07015 is present, the time in p0607 is started. If the fault is still present after this time has expired, then fault F07016 is output; however, at the earliest, 50 ms after alarm A07015.

See also: p0607 (Temperature sensor fault timer)

Remedy:

- make sure that the sensor is connected correctly.
- check the parameterization (p0601).
- induction motors: De-activate temperature sensor fault (p0607 = 0).

Drive: Incorrect control parameter

Message class:

Error in the parameterization / configuration / commissioning procedure (18)

Reaction:

NONE

Acknowledge:

IMMEDIATELY (POWER ON)

Cause:

The closed-loop control parameters have been parameterized incorrectly (e.g. p0356 = L_spread = 0).

Fault value (r0949, interpret decimal):

The fault value includes the parameter number involved.

See also: p0310, p0311, p0341, p0344, p0350, p0354, p0356, p0357, p0358, p0360, p0640, p1082, p1300

Remedy:

Modify the parameter indicated in the fault value (r0949) (e.g. p0640 = current limit > 0).

Macro: Execution not possible

Message class:

Error in the parameterization / configuration / commissioning procedure (18)

Reaction:

NONE

Acknowledge:

IMMEDIATELY

Cause:

The macro cannot be executed.

Fault value (r0949, interpret hexadecimal):

ccccbbaa hex:

cccc = preliminary parameter number, bb = supplementary information, aa = fault cause

Fault causes for the trigger parameter itself:

19: Called file is not valid for the trigger parameter.

20: Called file is not valid for parameter 15.

21: Called file is not valid for parameter 700.

22: Called file is not valid for parameter 1000.

23: Called file is not valid for parameter 1500.

24: Data type of a TAG is incorrect (e.g. Index, number or bit is not U16).

Fault causes for the parameters to be set:

25: Error level has an undefined value.

26: Mode has an undefined value.

27: A value was entered as string in the tag value that is not "DEFAULT".

31: Entered drive object type unknown.

32: A device was not able to be found for the determined drive object number.

34: A trigger parameter was recursively called.

35: It is not permissible to write to the parameter via macro.

36: Check, writing to a parameter unsuccessful, parameter can only be read, not available, incorrect data type, value range or assignment incorrect.

37: Source parameter for a BICO interconnection was not able to be determined.

38: An index was set for a non-indexed (or CDS-dependent) parameter.

39: No index was set for an indexed parameter.

41: A bit operation is only permissible for parameters with the parameter format DISPLAY_BIN.

42: A value not equal to 0 or 1 was set for a BitOperation.

43: Reading the parameter to be changed by the BitOperation was unsuccessful.

4 Faults and alarms

4.2 List of faults and alarms

51: Factory setting for DEVICE may only be executed on the DEVICE.

61: The setting of a value was unsuccessful.

Remedy:

- check the parameter involved.
- check the macro file and BICO interconnection.

Macro: ACX file not found

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: The ACX file (macro) to be executed was not able to be found in the appropriate directory.

Fault value (r0949, interpret decimal):

Parameter number with which the execution was started.

See also: p0015, p1000, p1500

Remedy:

- check whether the file is saved in the appropriate directory on the memory card.

F07084

Macro: Condition for WaitUntil not fulfilled

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: The WaitUntil condition set in the macro was not fulfilled in a certain number of attempts.

Fault value (r0949, interpret decimal):

Parameter number for which the condition was set.

Remedy:

Check and correct the conditions for the WaitUntil loop.

F07086

Units changeover: Parameter limit violation due to reference value change

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: A reference parameter was changed in the system. This resulted in the fact that for the parameters involved, the selected value was not able to be written in the per unit notation.

The values of the parameters were set to the corresponding violated minimum limit/maximum limit or to the factory setting.

Possible causes:

- the steady-state minimum limit/maximum limit or that defined in the application was violated.

Fault value (r0949, parameter):

Diagnostics parameter to display the parameters that were not able to be re-calculated.

See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004

Remedy:

Check the adapted parameter value and if required correct.

F07088

Units changeover: Parameter limit violation due to units changeover

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: A changeover of units was initiated. This resulted in a violation of a parameter limit

Possible causes for the violation of a parameter limit:

- When rounding off a parameter corresponding to its decimal places, the steady-state minimum limit or maximum limit was violated.

- inaccuracies for the data type "FloatingPoint".

In these cases, when the minimum limit is violated then the parameter value is rounded up and when the maximum limit is violated the parameter value is rounded down.

Fault value (r0949, interpret decimal):

Diagnostics parameter r9451 to display all parameters whose value had to be adapted.

See also: p0100 (IEC/NEMA mot stds), p0505 (Selecting the system of units), p0595 (Technological unit selection)

Remedy:

Check the adapted parameter values and if required correct.

A07089	Changing over units: Function module activation is blocked because the units have been changed over
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	An attempt was made to activate a function module. This is not permissible if the units have already been changed over. See also: p0100 (IEC/NEMA mot stds), p0505 (Selecting the system of units)
Remedy:	Restore units that have been changed over to the factory setting.
A07092	Drive: moment of inertia estimator still not ready
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The moment of inertia estimator still has no valid values. The acceleration cannot be calculated. The moment of inertia estimator is ready, if the frictional values (p1563, p1564) as well as the moment of inertia value (p1493) have been determined (r1407.26 = 1).
Remedy:	Repeat the operation when the moment of inertia estimator is ready (r1407.26 = 1).
A07094	General parameter limit violation
Message class:	Hardware/software error (1)
Reaction:	NONE
Acknowledge:	NONE
Cause:	As a result of the violation of a parameter limit, the parameter value was automatically corrected. Minimum limit violated --> parameter is set to the minimum value. Maximum limit violated --> parameter is set to the maximum value. Alarm value (r2124, interpret decimal): Parameter number, whose value had to be adapted.
Remedy:	Check the adapted parameter values and if required correct.
A07200	Drive: Master control ON command present
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The ON/OFF1 command is present (no 0 signal). The command is either influenced via binector input p0840 (current CDS) or control word bit 0 via the master control.
Remedy:	Switch the signal via binector input p0840 (current CDS) or control word bit 0 via the master control to 0.
F07220 (N, A)	Drive: Master control by PLC missing
Message class:	Communication error to the higher-level control system (9)
Reaction:	OFF1 (NONE, OFF2, OFF3, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	The "master control by PLC" signal was missing in operation. - interconnection of the binector input for "master control by PLC" is incorrect (p0854). - the higher-level control has withdrawn the "master control by PLC" signal. - data transfer via the fieldbus (master/drive) was interrupted.
Remedy:	- check the interconnection of the binector input for "master control by PLC" (p0854). - check the "master control by PLC" signal and, if required, switch in. - check the data transfer via the fieldbus (master/drive). Note: If the drive should continue to operate after withdrawing "master control by PLC" then fault response must be parameterized to NONE or the message type should be parameterized as alarm.

F07300 (A)	Drive: Line contactor feedback signal missing
Message class:	Auxiliary unit faulted (20)
Reaction:	OFF2 (NONE)
Acknowledge:	IMMEDIATELY
Cause:	<ul style="list-style-type: none"> - the line contactor was not able to be closed within the time in p0861. - the line contactor was not able to be opened within the time in p0861. - the line contactor dropped out during operation - the line contactor has closed although the drive converter is switched off.
Remedy:	<ul style="list-style-type: none"> - check the setting of p0860. - check the feedback circuit from the line contactor. - increase the monitoring time in p0861. <p>See also: p0860 (Line contactor feedback signal), p0861 (Line contactor monitoring time)</p>
F07320	Drive: Automatic restart interrupted
Message class:	Application/technological function faulted (17)
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	<ul style="list-style-type: none"> - the specified number of restart attempts (p1211) has been completely used up because within the monitoring time (p1213) the faults were not able to be acknowledged. The number of restart attempts (p1211) is decremented at each new start attempt. - the monitoring time for the power unit has expired (p0857). - when exiting commissioning or at the end of the motor identification routine or the speed controller optimization, the drive unit is not automatically switched on again. <p>Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.</p>
Remedy:	<ul style="list-style-type: none"> - increase the number of restart attempts (p1211). The actual number of starting attempts is displayed in r1214. - increase the delay time in p1212 and/or the monitoring time in p1213. - either increase or disable the monitoring time of the power unit (p0857). - reduce the delay time to reset the start counter (p1213[1]) so that fewer faults are registered in the time interval.
A07321	Drive: Automatic restart active
Message class:	Application/technological function faulted (17)
Reaction:	NONE
Acknowledge:	NONE
Cause:	<p>The automatic restart (AR) is active. When the line supply returns and/or the causes of the existing faults are removed the drive is automatically restarted. The pulses are enabled and the motor starts to rotate.</p> <p>For p1210 = 26, restarting is realized with the delayed setting of the ON command.</p>
Remedy:	<ul style="list-style-type: none"> - the automatic restart (AR) should, if required, be inhibited (p1210 = 0). - an automatic restart can be directly interrupted by withdrawing the switch-on command (BI: p0840). - for p1210 = 26: by withdrawing the OFF2- / OFF3 command.
F07330	Flying restart: Measured search current too low
Message class:	Application/technological function faulted (17)
Reaction:	OFF2 (NONE, OFF1)
Acknowledge:	IMMEDIATELY
Cause:	<p>During a flying restart, it was identified that the search current reached is too low.</p> <p>It is possible that the motor is not connected.</p>
Remedy:	Check the motor feeder cables.
F07331	Flying restart: Function not supported
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	OFF2 (NONE, OFF1)
Acknowledge:	IMMEDIATELY
Cause:	<p>It is not possible to power up with the motor rotating (no flying restart).</p> <p>In the following cases, the "flying restart" function is not supported:</p> <p>PMSM: operation with U/f characteristic and sensorless vector control.</p>

Note:
PMSM: permanent-magnet synchronous motor
Remedy: De-activate the "flying restart" function (p1200 = 0).

A07400 (N)	Drive: DC link voltage maximum controller active
Message class:	Application/technological function faulted (17)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The DC link voltage controller has been activated because the upper switch-in threshold has been exceeded (r1242, r1282). The ramp-down times are automatically increased in order to maintain the DC link voltage (r0070) within the permissible limits. There is a system deviation between the setpoint and actual speeds. When the DC link voltage controller is switched out (disabled), this is the reason that the ramp-function generator output is set to the speed actual value. See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller configuration (vector control)), p1280 (Vdc controller configuration (U/f))
Remedy:	If the controller is not to intervene: - increase the ramp-down times. - switch off the Vdc_max controller (p1240 = 0 for vector control, p1280 = 0 for U/f control). If the ramp-down times are not to be changed: - use a chopper or regenerative feedback unit.
A07401 (N)	Drive: DC link voltage maximum controller de-activated
Message class:	Application/technological function faulted (17)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The Vdc_max controller can no longer maintain the DC link voltage (r0070) below the limit value (r1242, r1282) and was therefore switched out (disabled). - the line supply voltage is permanently higher than specified for the power unit. - the motor is permanently in the regenerative mode as a result of a load that is driving the motor.
Remedy:	- check whether the input voltage is within the permissible range (if required, increase the value in p0210). - check whether the load duty cycle and load limits are within the permissible limits.
A07402 (N)	Drive: DC link voltage minimum controller active
Message class:	Application/technological function faulted (17)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The DC link voltage controller has been activated as the lower switch-in threshold has been undershot (r1246, r1286). The kinetic energy of the motor is used to buffer the DC link. The drive is therefore braked. See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller configuration (vector control)), p1280 (Vdc controller configuration (U/f))
Remedy:	The alarm disappears when power supply returns.
F07404	Drive: DC link voltage monitoring Vdc_max
Message class:	DC-link overvoltage (4)
Reaction:	OFF2 (NONE, OFF1, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The monitoring of the DC link voltage p1284 has responded (only U/f control).
Remedy:	- check the line supply voltage. - check the braking module. - adapt the device supply voltage (p0210). - adapt the DC link voltage monitoring (p1284).

F07405 (N, A)	Drive: Kinetic buffering minimum speed fallen below
Message class:	Application/technological function faulted (17)
Reaction:	OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	During kinetic buffering the speed fell below minimum speed (p1257 or p1297 for vector drives with U/f control) and the line supply did not return.
Remedy:	Check the speed threshold for the Vdc_min controller (kinetic buffering) (p1257, p1297). See also: p1257 (Vdc_min controller speed threshold), p1297 (Vdc_min controller speed threshold (U/f))
F07406 (N, A)	Drive: Kinetic buffering maximum time exceeded
Message class:	Application/technological function faulted (17)
Reaction:	OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	The maximum buffer time (p1255 and p1295 for vector drives with U/f control) has been exceeded without the line supply having returned.
Remedy:	Check the time threshold for Vdc-min controller (kinetic buffering) (p1255, p1295). See also: p1255 (Vdc_min controller time threshold), p1295 (Vdc_min controller time threshold (U/f))
A07409 (N)	Drive: U/f control, current limiting controller active
Message class:	Application/technological function faulted (17)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The current limiting controller of the U/f control was activated because the current limit was exceeded.
Remedy:	The alarm is automatically withdrawn after one of the following measures: <ul style="list-style-type: none">- increase current limit (p0640).- reduce the load.- slow down the ramp up to the setpoint speed.
F07410	Drive: Current controller output limited
Message class:	Application/technological function faulted (17)
Reaction:	OFF2 (NONE, OFF1)
Acknowledge:	IMMEDIATELY
Cause:	The condition " $I_{act} = 0$ and $U_q_set_1$ longer than 16 ms at its limit" is present and can be caused by the following: <ul style="list-style-type: none">- motor not connected or motor contactor open.- motor data and motor configuration (star-delta) do not match.- no DC link voltage present.- power unit defective.- the "flying restart" function is not activated.
Remedy:	<ul style="list-style-type: none">- connect the motor or check the motor contactor.- check the motor parameterization and the connection type (star-delta).- check the DC link voltage (r0070).- check the power unit.- activate the "flying restart" function (p1200).
F07411	Drive: Flux setpoint not reached when building up excitation
Message class:	Application/technological function faulted (17)
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	When quick magnetizing is configured (p1401.6 = 1) the specified flux setpoint is not reached although 90% of the maximum current is specified. <ul style="list-style-type: none">- incorrect motor data.- motor data and motor configuration (star-delta) do not match.- the current limit has been set too low for the motor.- induction motor (encoderless, open-loop controlled) in I_{2t} limiting.- power unit is too small.- the magnetizing time is too short.

- Remedy:**
- correct the motor data. Perform motor data identification and rotating measurement.
 - check the motor configuration.
 - correct the current limits (p0640).
 - reduce the induction motor load.
 - if necessary, use a larger power unit.
 - check motor supply cable.
 - check power unit.
 - increase p0346.

A07416	Drive: Flux controller configuration
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The configuration of the flux control (p1401) is contradictory. Alarm value (r2124, interpret hexadecimal): ccbbaaaa hex aaaa = Parameter bb = Index cc = fault cause 1: Quick magnetizing (p1401.6) for soft starting (p1401.0). 2: Quick magnetizing for flux build-up control (p1401.2). 3: Quick magnetizing (p1401.6) for Rs identification after restart (p0621 = 2).
Remedy:	For fault cause = 1: - Shut down soft start (p1401.0 = 0). - Shut down quick magnetizing (p1401.6 = 0). For fault cause = 2: - De-energize flux build-up control (p1401.2 = 0). - Shut down quick magnetizing (p1401.6 = 0). For fault cause = 3: - Re-parameterize Rs identification (p0621 = 0, 1) - Shut down quick magnetizing (p1401.6 = 0).

F07426 (A)	Technology controller actual value limited
Message class:	Application/technological function faulted (17)
Reaction:	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The actual value for the technology controller, interconnected via connector input p2264, has reached a limit. Fault value (r0949, interpret decimal): 1: upper limit reached. 2: lower limit reached.
Remedy:	- adapt the limits to the signal level (p2267, p2268). - check the actual value normalization (p0595, p0596). See also: p0595 (Technological unit selection), p0596 (Technological unit reference quantity), p2264 (Technology controller actual value), p2267 (Technology controller upper limit actual value), p2268 (Technology controller lower limit actual value)

A07428 (N)	Technology controller parameterizing error
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The technology controller has a parameterizing error. Alarm value (r2124, interpret decimal): 1: The upper output limit in p2291 is set lower than the lower output limit in p2292.

4 Faults and alarms

4.2 List of faults and alarms

Remedy: For alarm value = 1:
Set the output limit in p2291 higher than in p2292.
See also: p2291 (Technology controller maximum limiting), p2292 (Technology controller minimum limiting)

F07435 (N) Drive: Setting the ramp-function generator for sensorless vector control
Message class: Application/technological function faulted (17)
Reaction: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3)
Acknowledge: IMMEDIATELY
Cause: During operation with sensorless vector control (r1407.1) the ramp-function generator was stopped (p1141). An internal setting command of the ramp-function generator output caused the set setpoint speed to be frozen.
Remedy:
- de-activate the holding command for the ramp-function generator (p1141).
- suppress the fault (p2101, p2119). This is necessary if the ramp-function generator is held using jogging and the speed setpoint is simultaneously inhibited (r0898.6).

A07444 PID autotuning is activated
Message class: Application/technological function faulted (17)
Reaction: NONE
Acknowledge: NONE
Cause: Automatic setting of the PID controller parameters (PID autotuning) was activated (p2350).
See also: p2350 (Enable PID autotuning)
Remedy: Not necessary.
This alarm is automatically withdrawn after the PID autotuning has been completed.

F07445 PID autotuning canceled
Message class: Application/technological function faulted (17)
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The PID autotuning was canceled as a result of an error.
Remedy:
- increase the offset.
- check system configuration.

A07530 Drive: Drive Data Set DDS not present
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause: The selected drive data set is not available (p0837 > p0180). The drive data set was not changed over.
See also: p0180 (Number of Drive Data Sets (DDS)), p0820 (Drive Data Set selection DDS bit 0), p0821 (Drive Data Set selection DDS bit 1), r0837 (Drive Data Set DDS selected)
Remedy:
- select the existing drive data set.
- set up additional drive data sets.

A07531 Drive: Command Data Set CDS not present
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause: The selected command data set is not available (p0836 > p0170). The command data set was not changed over.
See also: p0810 (Command data set selection CDS bit 0), p0811 (Command data set selection CDS bit 1), r0836 (Command Data Set CDS selected)
Remedy:
- select the existing command data set.
- set up additional command data sets.

F07563 (A)	Drive encoder: XIST1_ERW configuration incorrect
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	An incorrect configuration was identified for the "Absolute position for incremental encoder" function. Fault value (r0949, interpret decimal): Fault cause: 1 (= 01 hex): The "Absolute value for incremental encoder" function is not supported (r0459.13 = 0). Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): yyxx dec: yy = fault cause, xx = encoder data set
Remedy:	For fault value = 1: - upgrade the Sensor Module firmware version. - check the mode (p4652 = 1, 3 requires the property r0459.13 = 1).
F07754	Drive: Incorrect shutoff valve configuration
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	An incorrect shutoff valve configuration was detected. Fault value (r0949, interpret decimal): 100: Enable Safety Integrated (p9601/p9801), but p0218.0 = 0 (shutoff valve not available). 101: The manipulated variable inhibit time is set less than the wait time to evaluate the feedback signal contacts when switching on the shutoff valve (p0230 < p9625[0]/p9825[0]). 102: The manipulated variable inhibit time is set less than the wait time to evaluate the feedback signal contacts when switching off the shutoff valve (p0230 < p9625[1]/p9825[1]).
Remedy:	For fault value = 100: Check the enable of Safety Integrated and the shutoff valve (p9601/p9801, p0218.0). For fault value = 101: Set the manipulated variable inhibit time higher than the wait time to evaluate the feedback signal contacts when switching on the shutoff valve (p0230 > p9625[0]/p9825[0]). For fault value = 102: Set the manipulated variable inhibit time higher than the wait time to evaluate the feedback signal contacts when switching off the shutoff valve (p0230 > p9625[1]/p9825[1]). See also: p0230 (Drive filter type motor side)
F07800	Drive: No power unit present
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The power unit parameters cannot be read or no parameters are stored in the power unit. Note: This fault also occurs if an incorrect topology was selected in the commissioning software and this parameterization is then downloaded to the Control Unit. See also: r0200 (Power unit code number actual)
Remedy:	- carry out a POWER ON (switch-off/switch-on) for all components. - check the power unit and replace if necessary. - check the Control Unit, and if required replace it. - after correcting the topology, the parameters must be again downloaded using the commissioning software.

F07801	Drive: Motor overcurrent
Message class:	Motor overload (8)
Reaction:	OFF2 (NONE, OFF1, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	<p>The permissible motor limit current was exceeded.</p> <ul style="list-style-type: none"> - effective current limit set too low. - current controller not correctly set. - U/f operation: Up ramp was set too short or the load is too high. - U/f operation: Short-circuit in the motor cable or ground fault. - U/f operation: Motor current does not match current of power unit. - Switch to rotating motor without flying restart function (p1200). <p>Note:</p> <p>Limit current = 2 x minimum (p0640, 4 x p0305 x p0306) >= 2 x p0305 x p0306</p>

F07806	Drive: Regenerative power limit exceeded (F3E)
Message class:	Power electronics faulted (5)
Reaction:	OFF2 (IASC/DCBRK)
Acknowledge:	IMMEDIATELY
Cause:	<p>For blocksize power units, types PM250 and PM260, the regenerative rated power r0206[2] was exceeded for more than 10 s.</p> <p>See also: r0206 (Rated power unit power), p1531 (Power limit regenerative)</p>

Remedy:

- increase the down ramp.
- reduce the driving load.
- use a power unit with a higher regenerative feedback capability.
- for vector control, the regenerative power limit in p1531 can be reduced so that the fault is no longer triggered.

F07807 Drive: Short-circuit/ground fault detected

Message class: Ground fault / inter-phase short-circuit detected (7)

Reaction: OFF2 (NONE)

Acknowledge: IMMEDIATELY

Cause: A phase-phase short-circuit or ground fault was detected at the motor-side output terminals of the converter.
Fault value (r0949, interpret decimal):
1: Short-circuit, phase UV.
2: Short-circuit, phase UW.
3: Short-circuit, phase VW.
4: Ground fault with overcurrent.
1yxxx: Ground fault with current in phase U detected (y = pulse number, xxxx = component of the current in phase V in per mille).
2yxxx: Ground fault with current in phase V detected (y = pulse number, xxxx = component of the current in phase U in per mille).
Note:
Also when interchanging the line and motor cables is identified as a motor-side short circuit.
The ground fault test only functions when the motor is stationary.
Connecting to a motor that is either not de-energized or partially de-energized is possibly detected as ground fault.

Remedy:

- check the motor-side converter connection for a phase-phase short-circuit.
- rule-out interchanged line and motor cables.
- check for a ground fault.

For a ground fault the following applies:

- do not enable the pulses when connecting to a rotating motor without the "Flying restart" function activated (p1200).
- increase the de-energization time (p0347).
- increase pulse suppression delay time (p1228) to ensure standstill.
- if required, de-activate the monitoring (p1901).

A07920 Drive: Torque/speed too low

Message class: Application/technological function faulted (17)
Reaction: NONE
Acknowledge: NONE
Cause: For p2193 = 1:
The torque deviates from the torque/speed envelope characteristic (too low).
For p2193 = 2:
The speed signal from the external encoder (refer to p3230) deviates from the speed (r2169) (too low).
See also: p2181 (Load monitoring response)

Remedy:

- check the connection between the motor and load.
- adapt the parameterization corresponding to the load.

A07921 Drive: Torque/speed too high

F07924	Drive: Torque/speed too high
Message class:	Application/technological function faulted (17)
Reaction:	OFF1 (NONE, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	For p2193 = 1: The torque deviates from the torque/speed envelope characteristic (too high). For p2193 = 2: The speed signal from the external encoder (refer to p3230) deviates from the speed (r2169) (too high).
Remedy:	- check the connection between the motor and load. - adapt the parameterization corresponding to the load.

F07925	Drive: Torque/speed out of tolerance
Message class:	Application/technological function faulted (17)
Reaction:	OFF1 (NONE, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	For p2193 = 1: The torque deviates from the torque/speed envelope characteristic. For p2193 = 2: The speed signal from the external encoder (refer to p3230) deviates from the speed (r2169).
Remedy:	- check the connection between the motor and load. - adapt the parameterization corresponding to the load.

A07926	Drive: Envelope curve parameter invalid
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	Invalid parameter values were entered for the envelope characteristic of the load monitoring. The following rules apply for the speed thresholds: p2182 < p2183 < p2184 The following rules apply for the torque thresholds: p2185 > p2186 p2187 > p2188 p2189 > p2190 Load monitoring configuration and response must match. It is not permissible that the individual load torque monitoring areas overlap. Alarm value (r2124, interpret decimal): Number of the parameter with the invalid value. The load torque monitoring has not been activated as long as the alarm is active.
Remedy:	- set the parameters for the load monitoring according to the applicable rules. - if necessary, de-activate the load monitoring (p2181 = 0, p2193 = 0).

A07927	DC braking active
Message class:	Application/technological function faulted (17)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The motor is braked with DC current. DC braking is active. 1) A message with response DCBRK is active. The motor is braked with the braking current set in p1232 for the duration set in p1233. If the standstill threshold p1226 is undershot, then braking is prematurely canceled. 2) DC braking has been activated at binector input p1230 with the DC braking set (p1230 = 4). Braking current p1232 is injected until this binector input becomes inactive.
Remedy:	Not necessary. The alarm automatically disappears once DC braking has been executed.

A07929 (F)	Drive: No motor detected
Message class:	Application/technological function faulted (17)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The absolute current value is so small after enabling the inverter pulses that no motor is detected. Note: - for vector control and induction motor, fault F07902 follows this alarm. See also: p2179 (Output load identification current limit)
Remedy:	- check the motor feeder cables. - reduce the threshold value (p2179), e.g. for synchronous motors. - check the voltage boost of the U/f control (p1310). - carry out a standstill measurement to set the stator resistance (p0350).
F07936	Drive: load failure
Message class:	Application/technological function faulted (17)
Reaction:	OFF1 (NONE, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The load monitoring has detected a load failure.
Remedy:	- check the sensor. - if necessary, de-activate the load monitoring (p2193). See also: p2193 (Load monitoring configuration), p3232 (Load monitoring failure detection)
F07950 (A)	Motor parameter incorrect
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The motor parameters were incorrectly entered while commissioning (e.g. p0300 = 0, no motor) Fault value (r0949, interpret decimal): Parameter number involved. See also: p0300, p0301, p0304, p0305, p0307, p0310, p0311, p0314, p0316, p0320, p0322, p0323
Remedy:	Compare the motor data with the rating plate data and if required, correct.
A07960	Drive: Incorrect friction characteristic
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The friction characteristic is incorrect. Alarm value (r2124, interpret decimal): 1538: The friction torque is greater than the maximum from the upper effective torque limit (p1538) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value. 1539: The friction torque is less than the minimum from the lower effective torque limit (p1539) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value. 3820 ... 3829: Incorrect parameter number. The speeds entered in the parameters for the friction characteristic do not correspond to the following condition: $0.0 < p3820 < p3821 < \dots < p3829 \leq p0322$ or $p1082$, if $p0322 = 0$ Therefore the output of the friction characteristic (r3841) is set to zero. 3830 ... 3839: Incorrect parameter number. The torques entered in the parameters for the friction characteristic do not correspond to the following condition: $0 \leq p3830, p3831 \dots p3839 \leq p0333$ Therefore the output of the friction characteristic (r3841) is set to zero. See also: r3840 (Friction characteristic status word)

Remedy: Fulfill the conditions for the friction characteristic.
For alarm value = 1538:
Check the upper effective torque limit (e.g. in the field weakening range).
For alarm value = 1539:
Check the lower effective torque limit (e.g. in the field weakening range).
For alarm value = 3820 ... 3839:
Fulfill the conditions to set the parameters of the friction characteristic.
If the motor data (e.g. the maximum speed p0322) are changed during commissioning (p0010 = 1, 3), then the technological limits and threshold values, dependent on this, must be re-calculated by selecting p0340 = 5).

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Reaction: NONE
Acknowledge: NONE
Cause: The automatic friction characteristic record is activated.
The friction characteristic is recorded at the next switch-on command.
When plotting the friction characteristic, it is not possible to save the parameters (p0971, p0977).
Remedy: Not necessary.
The alarm disappears automatically after the friction characteristic record has been successfully completed or the record is de-activated (p3845 = 0).

1111: Friction characteristic record, positive direction selected (p3845) and positive direction inhibited (p1111).
1198: Friction characteristic record selected (p3845 > 0) and negative (p1110) and positive directions (p1111) inhibited (r1198).
1300: The control mode (p1300) has not been set to closed-loop speed control.
1755: For encoderless closed-loop control (p1300 = 20), the lowest speed value to be approached (p3820) is less than or equal to the changeover speed, open-loop controlled operation (p1755).
1910: Motor data identification activated.
1960: Speed controller optimization activated.
3820 ... 3829: speed (p382x) cannot be approached.
3840: Friction characteristic incorrect.
3845: Friction characteristic record de-selected.
Remedy: Fulfill the conditions to record the friction characteristic.
For fault value = 0046:
- establish missing enable signals.
For fault value = 1082, 1084, 1087:
- Select the highest speed value to be approached (p3829) less than or equal to the maximum speed (p1082, r1084, r1087).
- Re-calculate the speed points along the friction characteristic (p0340 = 5).
For fault value = 1110:
- Select the friction characteristic record, positive direction (p3845).
For fault value = 1111:
- Select the friction characteristic record, negative direction (p3845).
For fault value = 1198:
- Enable the permitted direction (p1110, p1111, r1198).

For fault value = 1300:

- set the control mode (p1300) on the closed-loop speed control (p1300 = 20, 21).

For fault value = 1755:

- For encoderless closed-loop speed control (p1300 = 20) select the lowest speed value to be approached (p3820) greater than the changeover speed of open-loop controlled operation (p1755).
- Re-calculate the speed points along the friction characteristic (p0340 = 5).

For fault value = 1910:

- Exit the motor data identification routine (p1910).

For fault value = 1960:

- Exit the speed controller optimization routine (p1960).

For fault value 3820 ... 3829:

- check the load at speed p382x.
- check the speed signal (r0063) for oscillation at speed p382x. Check the settings of the speed controller if applicable.

For fault value = 3840:

- Make the friction characteristic error-free (p3820 ... p3829, p3830 ... p3839, p3840).

For fault value = 3845:

- Activate the friction characteristic record (p3845).

F07983 Drive: Rotating measurement saturation characteristic

Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	OFF1 (NONE, OFF2)
Acknowledge:	IMMEDIATELY
Cause:	A fault has occurred while determining the saturation characteristic. Fault value (r0949, interpret decimal): 1: The speed did not reach a steady-state condition. 2: The rotor flux did not reach a steady-state condition. 3: The adaptation circuit did not reach a steady-state condition. 4: The adaptation circuit was not enabled. 5: Field weakening active. 6: The speed setpoint was not able to be approached as the minimum limiting is active. 7: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active. 8: The speed setpoint was not able to be approached as the maximum limiting is active. 9: Several values of the determined saturation characteristic are not plausible. 10: Saturation characteristic could not be sensibly determined because load torque too high.
Remedy:	For fault value = 1: - the total drive moment of inertia is far higher than that of the motor (p0341, p0342). De-select rotating measurement (p1960), enter the moment of inertia p0342, re-calculate the speed controller p0340 = 4 and repeat the measurement. For fault value = 1 ... 2: - increase the measuring speed (p1961) and repeat the measurement. For fault value = 1 ... 4: - check the motor parameters (rating plate data). After the change: Calculate p0340 = 3. - check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3. - carry out a motor data identification routine (p1910). - if required, reduce the dynamic factor (p1967 < 25 %). For fault value = 5: - the speed setpoint (p1961) is too high. Reduce the speed.

For fault value = 6:

- adapt the speed setpoint (p1961) or minimum limiting (p1080).

For fault value = 7:

- adapt the speed setpoint (p1961) or suppression (skip) bandwidths (p1091 ... p1094, p1101).

For fault value = 8:

- adapt the speed setpoint (p1961) or maximum limit (p1082, p1083 and p1086).

For fault value = 9, 10:

- the measurement was carried out at an operating point where the load torque is too high. Select a more suitable operating point, either by changing the speed setpoint (p1961) or by reducing the load torque. The load torque may not be varied while making measurements.

Note:

The saturation characteristic identification routine can be disabled using p1959.1.

Message class:

Error in the parameterization / configuration / commissioning procedure (18)

Reaction:

OFF1 (NONE, OFF2)

Acknowledge:

IMMEDIATELY

Cause:

A fault has occurred while identifying the moment of inertia.

Fault value (r0949, interpret decimal):

1: The speed did not reach a steady-state condition.

2: The speed setpoint was not able to be approached as the minimum limiting is active.

3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active.

4: The speed setpoint was not able to be approached as the maximum limiting is active.

5: It is not possible to increase the speed by 10% as the minimum limiting is active.

6: It is not possible to increase the speed by 10% as the suppression (skip) bandwidth is active.

7: It is not possible to increase the speed by 10% as the maximum limiting is active.

8: The torque difference after the speed setpoint step is too low in order to be able to still reliably identify the moment of inertia.

9: Too few data to be able to reliably identify the moment of inertia.

10: After the setpoint step, the speed either changed too little or in the incorrect direction.

11: The identified moment of inertia is not plausible. The measured moment of inertia is less than the 0.1x or greater than 500x the preset moment of inertia of the motor p0341.

Remedy:

For fault value = 1:

- check the motor parameters (rating plate data). After the change: Calculate p0340 = 3.

- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.

- carry out a motor data identification routine (p1910).

- if required, reduce the dynamic factor (p1967 < 25 %).

For fault value = 2, 5:

- adapt the speed setpoint (p1965) or adapt the minimum limit (p1080).

For fault value = 3, 6:

- adapt the speed setpoint (p1965) or suppression (skip) bandwidths (p1091 ... p1094, p1101).

For fault value = 4, 7:

- adapt the speed setpoint (p1965) or maximum limit (p1082, p1083 and p1086).

For fault value = 8:

- the total drive moment of inertia is far higher than that of the motor (refer to p0341, p0342). De-select rotating measurement (p1960), enter the moment of inertia p0342, re-calculate the speed controller p0340 = 4 and repeat the measurement.

For fault value = 9:

- check the moment of inertia (p0341, p0342). After the change, re-calculate (p0340 = 3 or 4).

For fault value = 10:

- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.

For fault value = 11:

- reduce the moment of inertia of the motor p0341 (e.g., factor of 0.2) or increase (e.g. factor of 5) and repeat the measurement.

Note:

The moment of inertia identification routine can be disabled using p1959.2.

F30002 Power unit: DC link voltage overvoltage

Message class: DC-link overvoltage (4)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The power unit has detected an overvoltage condition in the DC link.

- motor regenerates too much energy.
- line supply voltage too high.
- line phase interrupted.
- DC-link voltage control switched off.
- dynamic response of DC-link voltage controller excessive or insufficient.

Fault value (r0949, interpret decimal):

DC link voltage at the time of trip [0.1 V].

Remedy:

- increase the ramp-down time (p1121).
- set the rounding times (p1130, p1136). This is particularly recommended in U/f operation to relieve the DC link voltage controller with rapid ramp-down times of the ramp-function generator.
- Activate the DC link voltage controller (p1240, p1280).
- adapt the dynamic response of the DC-link voltage controller (p1243, p1247, p1283, p1287).
- check the line supply and DC link voltage. set p0210 as low as possible (also see A07401, p1294 = 0).
- check and correct the phase assignment at the power unit.
- check the line supply phases.

F30003 Power unit: DC link voltage undervoltage

Message class: Infeed faulted (13)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The power unit has detected an undervoltage condition in the DC link.

- line supply failure
- line supply voltage below the permissible value.
- line phase interrupted.

Note:

The monitoring threshold for the DC link undervoltage is the minimum of the following values:

- for a calculation, refer to p0210.

Remedy:

- check the line supply voltage
- check the line supply phases.

F30004 Power unit: Overtemperature heat sink AC inverter

Message class: Power electronics faulted (5)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The temperature of the power unit heat sink has exceeded the permissible limit value.

- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.

Fault value (r0949, interpret decimal):

Temperature [1 bit = 0.01 °C].

Remedy:

- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
- check the motor load.
- reduce the pulse frequency if this is higher than the rated pulse frequency.

Notice:

This fault can only be acknowledged after the alarm threshold for alarm A05000 has been undershot.

F30015 (N, A) Power unit: Phase failure motor cable

Message class: Application/technological function faulted (17)
Reaction: OFF2 (NONE, OFF1, OFF3)
Acknowledge: IMMEDIATELY
Cause: A phase failure in the motor feeder cable was detected.
The signal can also be output in the following cases:
- the motor is correctly connected, but the drive has stalled in U/f control. In this case, a current of 0 A is possibly measured in one phase due to asymmetry of the currents.
- the motor is correctly connected, however the closed-speed control is instable and therefore an oscillating torque is generated.
Note:
Chassis power units do not feature phase failure monitoring.
Remedy:
- check the motor feeder cables.
- increase the ramp-up or ramp-down time (p1120) if the drive has stalled in U/f control.
- check the speed controller settings.

A30016 (N) Power unit: Load supply switched out

Message class: Network fault (2)
Reaction: NONE

Cause: The DC link voltage is too low.
Alarm value (r2124, interpret decimal):
DC link voltage at the time of trip [0.1 V].
Remedy: Under certain circumstances, the AC line supply is not switched on.

F30017 Power unit: Hardware current limit has responded too often

Message class: Power electronics faulted (5)
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The hardware current limitation in the relevant phase (see A30031, A30032, A30033) has responded too often. The number of times the limit has been exceeded depends on the design and type of power unit.
- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.

- motor load too high
 - power unit defective.
- Fault value (r0949, interpret binary):
- Bit 0: Phase U
- Bit 1: Phase V
- Bit 2: Phase W
- Remedy:**
- check the motor data.
 - check the motor circuit configuration (star-delta).
 - check the motor load.
 - check the power cable connections.
 - check the power cables for short-circuit or ground fault.
 - check the length of the power cables.
 - replace power unit.

- Cause:** The power has detected a ground fault.
- Possible causes:
- ground fault in the power cables.
 - ground fault at the motor.
 - CT defective.
 - when the brake closes, this causes the hardware DC current monitoring to respond.
 - short-circuit at the braking resistor.
- Fault value (r0949, interpret decimal):
- 0:
- the hardware DC current monitoring has responded.
 - short-circuit at the braking resistor.
- > 0:
- Absolute value, summation current [32767 = 271 % rated current].
- Remedy:**
- check the power cable connections.
 - check the motor.
 - check the CT.
 - check the cables and contacts of the brake connection (a wire is possibly broken).
 - check the braking resistor.

Power unit: Monitoring U_{ce}

- Message class:** Ground fault / inter-phase short-circuit detected (7)
- Reaction:** OFF2
- Acknowledge:** POWER ON
- Cause:** In the power unit, the monitoring of the collector-emitter voltage (U_{ce}) of the semiconductor has responded.
- Possible causes:
- fiber-optic cable interrupted.
 - power supply of the IGBT gating module missing.
 - short-circuit at the power unit output.
 - defective semiconductor in the power unit.
- Fault value (r0949, interpret binary):
- Bit 0: Short-circuit in phase U
- Bit 1: Short circuit in phase V
- Bit 2: Short-circuit in phase W
- Bit 3: Light transmitter enable defective
- Bit 4: U_{ce} group fault signal interrupted
- See also: r0949 (Fault value)

- Remedy:**
- check the fiber-optic cable and if required, replace.
 - check the power supply of the IGBT gating module (24 V).
 - check the power cable connections.
 - select the defective semiconductor and replace.

F30024 Power unit: Overtemperature thermal model

- Message class:** Power electronics faulted (5)
Reaction: OFF2

Cause: The temperature difference between the heat sink and chip has exceeded the permissible limit value.
- the permissible load duty cycle was not maintained.
 - insufficient cooling, fan failure.
 - overload.
 - ambient temperature too high.
 - pulse frequency too high.
- See also: r0037 (Power unit temperatures)
- Remedy:**
- adapt the load duty cycle.
 - check whether the fan is running.
 - check the fan elements.
 - check whether the ambient temperature is in the permissible range.
 - check the motor load.
 - reduce the pulse frequency if this is higher than the rated pulse frequency.
 - if DC braking is active: reduce braking current (p1232).

F30027 Power unit: Precharging DC link time monitoring

- Message class:** Infeed faulted (13)
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The power unit DC link was not able to be precharged within the expected time.
- 1) There is no line supply voltage connected.
 - 2) The line contactor/line side switch has not been closed.
 - 3) The line supply voltage is too low.
 - 4) Line supply voltage incorrectly set (p0210).

- 5) The precharging resistors are overheated as there were too many precharging operations per time unit.
- 6) The precharging resistors are overheated as the DC link capacitance is too high.
- 7) The DC link has either a ground fault or a short-circuit.
- 8) Precharging circuit may be defective.

Fault value (r0949, interpret binary):

yyyyxxxx hex:

yyyy = power unit state

0: Fault status (wait for OFF and fault acknowledgment).

1: Restart inhibit (wait for OFF).

2: Overvoltage condition detected -> change into the fault state.

3: Undervoltage condition detected -> change into the fault state.

4: Wait for bridging contactor to open -> change into the fault state.

5: Wait for bridging contactor to open -> change into restart inhibit.

6: Commissioning.

7: Ready for precharging.

8: Precharging started, DC link voltage less than the minimum switch-on voltage.

9: Precharging, DC link voltage end of precharging still not detected.

10: Wait for the end of the de-bounce time of the main contactor after precharging has been completed.

11: Precharging completed, ready for pulse enable.

12: Reserved.

xxxx = Missing internal enable signals, power unit (inverted bit-coded, FFFF hex -> all internal enable signals available)

Bit 0: Power supply of the IGBT gating shut down.

Bit 1: Ground fault detected.

Bit 2: Peak current intervention.

Bit 3: I2t exceeded.

Bit 4: Thermal model overtemperature calculated.

Bit 5: (heat sink, gating module, power unit) overtemperature measured.

Bit 6: Reserved.

Bit 7: Overvoltage detected.

Bit 8: Power unit has completed precharging, ready for pulse enable.

Bit 9: Reserved.

Bit 10: Overcurrent detected.

Bit 11: Reserved.

Bit 12: Reserved.

Bit 13: Vce fault detected, transistor de-saturated due to overcurrent/short-circuit.

Bit 14: Undervoltage detected.

See also: p0210 (Drive unit line supply voltage)

Remedy:

In general:

- check the line supply voltage at the input terminals.
- check the line supply voltage setting (p0210).
- wait until the precharging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.

For 5):

- carefully observe the permissible precharging frequency (refer to the appropriate Equipment Manual).

For 6):

- check the capacitance of the DC link and, if necessary, reduce it in accordance with the maximum permissible DC link capacitance (see relevant Equipment Manual).

For 7):

- check the DC link for a ground fault or short circuit.

F30036 Power unit: Internal overtemperature

Message class: Power electronics faulted (5)
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The temperature inside the drive converter has exceeded the permissible temperature limit.
- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
Fault value (r0949, interpret decimal):
Only for internal Siemens troubleshooting.
Remedy: - check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
Notice:
This fault can only be acknowledged once the permissible temperature limit minus 5 K has been fallen below.

F30037 Power unit: Rectifier overtemperature

Message class: Power electronics faulted (5)
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The temperature in the rectifier of the power unit has exceeded the permissible temperature limit.
- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- line supply phase failure.
Fault value (r0949, interpret decimal):
Temperature [0.01 °C].
Remedy: - check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
- check the motor load.
- check the line supply phases.
Notice:
This fault can only be acknowledged after the alarm threshold for alarm A05004 has been undershot.

A30042 Power unit: Fan has reached the maximum operating hours

Message class: Power electronics faulted (5)
Reaction: NONE
Acknowledge: NONE
Cause: The maximum operating time of at least one fan will soon be reached, or has already been exceeded.
Alarm value (r2124, interpret binary):
Bit 0: heat sink fan will reach the maximum operating time in 500 hours.
Bit 1: heat sink fan has exceeded the maximum operating time.
Bit 8: internal device fan will reach the maximum operating time in 500 hours.
Bit 9: internal device fan has exceeded the maximum operating time.
Note:
The maximum operating time of the heat sink fan in the power unit is displayed in p0252.
The maximum operating time of the internal device fan in the power unit is internally specified and is fixed.
Remedy: For the fan involved, carry out the following:
- replace the fan.
- reset the operating hours counter (p0251, p0254).

A30049	Power unit: Internal fan faulty
Message class:	Auxiliary unit faulted (20)
Reaction:	NONE

Cause:	When the brake is being opened, it is detected that the power supply voltage is less than 21.4 V Alarm value (r2124, interpret decimal): Supply voltage fault [0.1 V]. Example: Alarm value = 195 --> voltage = 19.5 V
Remedy:	Check the 24 V voltage for stability and value.
F30055	Power unit: Braking chopper overcurrent
Message class:	Braking Module faulted (14)
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	An overcurrent condition has occurred in the braking chopper.
Remedy:	- check whether the braking resistor has a short circuit. - for an external braking resistor, check whether the resistor may have been dimensioned too small. Note: The braking chopper is only enabled again at pulse enable after the fault has been acknowledged.

A30057	Power unit: Line asymmetry
Message class:	Network fault (2)
Reaction:	NONE
Acknowledge:	NONE
Cause:	Frequencies have been detected on the DC link voltage that would suggest line asymmetry or failure of a line phase. It is also possible that a motor phase has failed. Fault F30011 is output if the alarm is present and at the latest after 5 minutes. The precise duration depends on the power unit type and the particular frequencies. For booksize and chassis power units, the duration also depends on how long the alarm has been active. Alarm value (r2124, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	- check the line phase connection. - check the motor feeder cable connections. If there is no phase failure of the line or motor, then line asymmetry is involved. - reduce the power in order to avoid fault F30011.
F30059	Power unit: Internal fan faulty
Message class:	Auxiliary unit faulted (20)
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The internal power unit fan has failed and is possibly defective.
Remedy:	Check the internal fan and replace if necessary.
A30065 (F, N)	Voltage measured values not plausible
Message class:	Power electronics faulted (5)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The voltage measurement is not supplying any plausible values Alarm value (r2124, interpret bitwise binary): Bit 1: Phase U. Bit 2: Phase V. Bit 3: Phase W.
Remedy:	- De-activate voltage measurement (p0247.0 = 0). - De-activate flying restart with voltage measurement (p0247.5 = 0) and de-activate fast flying restart (p1780.11 = 0).

Cause:	<p>The power unit has detected an excessive rate of rise in the overvoltage range.</p> <ul style="list-style-type: none"> - closed-loop control is incorrectly parameterized. - motor has a short-circuit or fault to ground (frame). - U/f operation: Up ramp set too low. - U/f operation: rated current of motor much greater than that of power unit. - power cables are not correctly connected. - power cables exceed the maximum permissible length. - power unit defective. <p>Fault value (r0949, interpret bitwise binary):</p> <p>Bit 0: Phase U.</p> <p>Bit 1: Phase V.</p> <p>Bit 2: Phase W.</p>

- Remedy:**
- check the motor data - if required, carry out commissioning.
 - check the motor circuit configuration (star-delta)
 - U/f operation: Increase up ramp.
 - U/f operation: Check assignment of rated currents of motor and power unit.
 - check the power cable connections.
 - check the power cables for short-circuit or ground fault.
 - check the length of the power cables.
 - replace power unit.

F30081 Power unit: Switching operations too frequent

Message class: Power electronics faulted (5)
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The power unit has executed too many switching operations for current limitation.

- closed-loop control is incorrectly parameterized.
- motor has a short-circuit or fault to ground (frame).
- U/f operation: Up ramp set too low.
- U/f operation: rated current of motor much greater than that of power unit.
- power cables are not correctly connected.
- power cables exceed the maximum permissible length.
- power unit defective.

Fault value (r0949, interpret bitwise binary):

F30105 PU: Actual value sensing fault

Message class: Power electronics faulted (5)
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: At least one incorrect actual value channel was detected on the Power Stack Adapter (PSA).
 The incorrect actual value channels are displayed in the following diagnostic parameters.

Remedy: Evaluate the diagnostic parameters.
 If the actual value channel is incorrect, check the components and if required, replace.

A30502 Power unit: DC link overvoltage

Message class: DC-link overvoltage (4)
Reaction: NONE
Acknowledge: NONE
Cause: The power unit has detected overvoltage in the DC link on a pulse inhibit.

- device connection voltage too high.
- line reactor incorrectly dimensioned.

Alarm value (r0949, interpret decimal):
 DC link voltage [1 bit = 100 mV].
 See also: r0070 (Actual DC link voltage)

Remedy:

- check the device supply voltage (p0210).
- check the dimensioning of the line reactor.

F30600

SI P2: STOP A initiated

Message class: Safety monitoring channel has identified an error (10)

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause:

The drive-integrated "Safety Integrated" function on processor 2 has detected an error and initiated a STOP A.

- forced checking procedure (test stop) of the safety switch-off signal path on processor 2 unsuccessful.
- subsequent response to fault F30611 (defect in a monitoring channel).

Fault value (r0949, interpret decimal):

0: Stop request from processor 1.

1005:

- Pulses suppressed although STO not selected and there is no internal STOP A present.
- For a Power Module with "STO via terminals at the Power Module" (STO_A/STO_B), these terminals are active (DIP switch to "ON"). However, the "STO via terminals at the Power Module" function has not been enabled (p9601.7 = p9801.7 = 0).

1010: Pulses enabled although STO is selected or an internal STOP A is present.

1011: Internal fault for the pulse enable in the Power Module.

1030: Feedback signal of the safety switch-off signal paths for the "STO via terminals at the Power Module" function different.

9999: Subsequent response to fault F30611.

Remedy:

- select Safe Torque Off and de-select again.
- carry out a POWER ON (switch-off/switch-on) for all components.
- replace Power Module involved.

For fault value = 1005:

- de-activate terminals STO_A/STO_B on the Power Module (set both DIP-switches to "OFF") or enable the "STO via terminals at the Power Module" function.

For fault value = 1030:

- check the discrepancy time, and if required, increase the value (p9650/p9850).
- check the STO terminal at the Power Module (contact problems).

For fault value = 9999:

- carry out diagnostics for fault F30611.

Note:

PM: Power Module

STO: Safe Torque Off

F30611 (A)

SI P2: Defect in a monitoring channel

Message class: Safety monitoring channel has identified an error (10)

Reaction: NONE (OFF1, OFF2, OFF3)

Acknowledge: IMMEDIATELY (POWER ON)

Cause:

The drive-integrated "Safety Integrated" function on processor 2 has detected a fault in the crosswise data comparison between the two monitoring channels and has initiated a STOP F.

As a consequence of this fault, fault F30600 (SI P2: STOP A initiated) is output.

Fault value (r0949, interpret decimal):

0: Stop request from the other monitoring channel.

1 ... 999:

Number of the cross-compared data that resulted in this fault. This number is also displayed in r9795.

2: SI enable safety functions (p9601, p9801). Crosswise data comparison is only carried out for the supported bits.

3: SI F-DI changeover discrepancy time (p9650, p9850).

8: SI PROFIsafe address (p9610, p9810).

9: SI debounce time for STO (p9651, p9851).

1000: Watchdog timer has expired.
Within the time of approx. 5 x p9650, alternatively, the following was defined:

- the signal at F-DI continually changed with time intervals less than or equal to the discrepancy time (p9650/p9850).
- via PROFIsafe, STO (also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850).

1001, 1002: Initialization error, change timer / check timer.
2000: Status of the STO selection for both monitoring channels different.
2001: Feedback signal of the safe pulse suppression for both monitoring channels different.
2002: Status of the delay timer SS1 for both monitoring channels different (status of the timer in p9650/p9850).
2003: Status of the STO terminal for processor 1 and processor 2 different.
6000 ... 6999:
Error in the PROFIsafe control.
For these fault values, the failsafe control signals (failsafe values) are transferred to the safety functions.
The significance of the individual message values is described in safety fault F01611.

Remedy:
For fault values 1 ... 999 described in "Cause":

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (switch-off/switch-on).

For fault value = 1000:

- check the wiring of the F-DI (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the discrepancy time, and if required, increase the value (p9650/p9850).

For fault value = 1001, 1002:

- carry out a POWER ON (switch-off/switch-on).

For fault value = 2000, 2001, 2002, 2003:

- check the discrepancy time, and if required, increase the value (p9650/p9850).
- check the wiring of the F-DI (contact problems).
- check the causes of the STO selection in r9772. When the SI Motion functions are active (p9501 = 1), STO can also be selected using these functions.

For fault value = 6000 ... 6999:
Refer to the description of the message values in safety fault F01611.
For fault values that are described in "Cause":

- carry out a POWER ON (switch-off/switch-on).
- contact Technical Support.
- replace Control Unit.

Note:

Remedy:

- For fault value = 130:
 - carry out safety commissioning routine.
- For fault value = 1000:
 - again carry out safety commissioning routine.
 - replace the memory card or Control Unit.
 - Using STARTER, activate the safety parameters for the drive involved (change settings, copy parameters, activate settings).
- For fault value = 2000:
 - check the safety parameters on processor 2 and adapt the reference checksum (p9899).
- For fault value = 2003:
 - carry out an acceptance test and generate an acceptance report.
- For fault value = 2010:
 - check the enable the safety-related brake control on both monitoring channels (p9602 = p9802).
- For fault value = 9999:
 - carry out diagnostics for the other safety-related fault that is present.

Message class: Hardware/software error (1)

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: When accessing the Safety Integrated parameters for the processor 2 in the non-volatile memory, an error has occurred.

Note:

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

- 129: Safety parameters for processor 2 corrupted.
- 131: Internal software error on processor 1.
- 255: Internal software error on processor 2.

- Remedy:**
- re-commission the safety functions.
 - replace the memory card or Control Unit.
- For fault value = 129:
- activate the safety commissioning mode (p0010 = 95).
 - start the copy function for SI parameters (p9700 = D0 hex).
 - acknowledge data change (p9701 = DC hex).
 - exit the safety commissioning mode (p0010 = 0).
 - save all parameters (p0971 = 1 or "copy RAM to ROM").
 - carry out a POWER ON (switch-off/switch-on) for the Control Unit.

F30659**SI P2: Write request for parameter rejected**

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The write request for one or several Safety Integrated parameters on processor 2 was rejected.

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

10: An attempt was made to enable the STO function although this cannot be supported.

15: An attempt was made to enable the motion monitoring functions integrated in the drive although these cannot be supported.

16: An attempt was made to enable the PROFIsafe communications although this cannot be supported.

18: An attempt was made to enable the PROFIsafe function for Basic Functions although this cannot be supported.

20: An attempt was made to simultaneously enable both the drive-integrated motion monitoring functions via integrated F-DI and STO via terminals, even though these cannot be supported at the same time.

28: An attempt was made to enable the "STO via terminals at the Power Module" function although this cannot be supported.

See also: r9771, r9871

Remedy:

For fault value = 10, 15, 16, 18:

- check whether there are faults in the safety function alignment (F01655, F30655) and if required, carry out diagnostics for the faults involved.

- use a Control Unit that supports the required function.

For fault value = 28:

- use the power unit with the feature "STO via terminals at the Power Module".

F30680	SI Motion P2: Checksum error safety monitoring functions
Message class:	Safety monitoring channel has identified an error (10)
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	<p>The actual checksum calculated by processor 2 and entered in r9398 over the safety-relevant parameters does not match the reference checksum saved in p9399 at the last machine acceptance.</p> <p>Safety-relevant parameters have been changed or a fault is present.</p> <p>Note:</p> <p>This fault results in a STOP A that can be acknowledged.</p> <p>Fault value (r0949, interpret decimal):</p> <p>0: Checksum error for SI parameters for motion monitoring.</p> <p>1: Checksum error for SI parameters for component assignment.</p>

- Remedy:**
- check the safety-relevant parameters and if required, correct.
 - set the reference checksum to the actual checksum.
 - execute the function "Copy RAM to ROM".
 - perform a POWER ON if safety parameters requiring a POWER ON have been modified.
 - carry out an acceptance test.

F30681**SI Motion P1: Incorrect parameter value**

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The parameter cannot be parameterized with this value.

Note:

This message does not result in a safety stop response.

Fault value (r0949, interpret decimal):

xxxxxxx dec: yyyy = supplementary information, xxxx = parameter

yyyy = 0:

No information available.

xxxx = 9301:

It is not permissible to enable the function "n < nx hysteresis and filtering" (p9301.16) in conjunction with the function "Extended functions without selection" (p9801.5).

xxxx = 9385:

For Safety without encoder and synchronous motor, p9385 must be set to 4.

Remedy: Correct the parameter value.

Note:

For different values in the two monitoring channels, start the copy function for SI parameters on the drive (p9700 = 57 hex).

F30682**SI Motion P2: Monitoring function not supported**

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF2

A30693 (F)	SI P2: Safety parameter settings changed, POWER ON required
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	Safety parameters have been changed; these will only take effect following a POWER ON. Notice: All changed parameters of the safety motion monitoring functions will only take effect following a POWER ON. Alarm value (r2124, interpret decimal): Parameter number of the safety parameter which has changed, necessitating a POWER ON.
Remedy:	- execute the function "Copy RAM to ROM". - carry out a POWER ON (switch-off/switch-on).
C30700	SI Motion P2: STOP A initiated
Message class:	Safety monitoring channel has identified an error (10)
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The drive is stopped via a STOP A (pulses are suppressed via the safety switch-off signal path of processor 1). Possible causes: - stop request from processor 1. - Pulses not suppressed after test stop selection. - subsequent response to the message C30706 "SI Motion P2: SAM/SBR limit exceeded". - subsequent response to the message C30714 "SI Motion P2: Safely Limited Speed exceeded". - subsequent response to the message C30701 "SI Motion P2: STOP B initiated".

- Remedy:**
- remove the cause of the fault on the monitoring channel of processor 1.
 - check the switch-off signal path of processor 2.
 - carry out a diagnostics routine for message C30706.
 - carry out a diagnostics routine for message C30714.

C30701

SI Motion P2: STOP B initiated

Message class: Safety monitoring channel has identified an error (10)

Reaction: NONE (OFF3)

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The drive is stopped via a STOP B (braking along the OFF3 deceleration ramp).
As a result of this fault, after the speed threshold parameterized in p9360 is fallen below, message C30700 "STOP A initiated" is output.

Possible causes:

- stop request from processor 1.
- subsequent response to the message C30714 "SI Motion P2: Safely Limited Speed exceeded".
- subsequent response to the message C30711 "SI Motion P2: Defect in a monitoring channel".
- subsequent response to the message C30707 "SI Motion P2: tolerance for safe operating stop exceeded".

- Remedy:**
- remove the cause of the fault on the monitoring channel of processor 1.
 - carry out a diagnostics routine for message C30714.
 - carry out a diagnostics routine for message C30711.
 - carry out a diagnostics routine for message C30707.

Note:

C30706

SI Motion P2: SAM/SBR limit exceeded

Message class: Safety monitoring channel has identified an error (10)

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause: Motion monitoring functions with set acceleration monitoring (SAM, p9306 = 3):
- after initiating STOP B (SS1) the velocity has exceeded the selected tolerance.
Motion monitoring functions with set brake ramp monitoring (SBR, p9306 = 1):
- after initiating STOP B (SS1) or SLS changeover to the lower speed stage, the speed has exceeded the selected tolerance.

The drive is shut down by the message C30700 "SI Motion P2: STOP A initiated".

Remedy: Check the braking behavior and, if necessary, adapt the parameterization of the parameter settings of the "SAM" or the "SBR" function.

This message can be acknowledged without a POWER ON using "Acknowledge internal event".

C30711

SI Motion P2: Defect in a monitoring channel

Message class: Safety monitoring channel has identified an error (10)

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause: When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

If at least one monitoring function is active, then message C30701 "SI Motion: STOP B initiated" is output.

The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:

- synchronization error between processor 1 and processor 2.

Message value (r2124, interpret decimal):

0 ... 999:

Number of the cross-compared data that resulted in this message.

The significance of the individual message values is described in safety message C01711.

1000: Watchdog timer has expired. Too many signal changes have occurred at the F-DI.

1001: Initialization error of watchdog timer.

1011: Acceptance test status between the monitoring channels differ.

1020: Cyc. communication failure between the monit. cycles.

1040: Pulses suppressed with active encoderless monitoring functions.

1041: Current absolute value too low (encoderless)

1042: Current/voltage plausibility error

1043: Too many acceleration phases

1044: Actual current values plausibility error.

See also: r9725 (SI Motion diagnostics STOP F)

Remedy:

For message value = 1040:

- de-select encoderless monitoring functions, select and de-select STO.

- if monitoring function is active, issue "SLS" pulse enable within 5 s of de-selecting STO.

For other message values:

- the significance of the individual message values is described in safety message C01711.

Note:

This message can be acknowledged using "Acknowledge internal event".

C30712

SI Motion P2: Defect in F-IO processing

Message class:

Safety monitoring channel has identified an error (10)

Reaction:

NONE

Acknowledge:

IMMEDIATELY (POWER ON)

Cause:

When cross checking and comparing the two monitoring channels, the drive detected a difference between parameters or results of the F-IO processing and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

The safety message C30711 with message value 0 is also displayed due to initiation of STOP F.

If at least one monitoring function is active, then safety message C30701 "SI Motion: STOP B initiated" is output.

Message value (r2124, interpret decimal):

Number of the cross-compared data that resulted in this message.

See safety message C01712 for a description of the message values.

Remedy:

- check parameterization in the parameters involved and correct if required.

- ensure equality by copying the SI data to processor 2 and then carry out an acceptance test.

Note:

This message can be acknowledged via F-DI or PROFIsafe.

C30714

SI Motion P2: Safely limited speed exceeded

Message class:

Safety monitoring channel has identified an error (10)

Reaction:

NONE

Acknowledge:

IMMEDIATELY (POWER ON)

Cause:

The drive had moved faster than that specified by the velocity limit value (p9331). The drive is stopped as a result of the configured stop response (p9363).

Message value (r2124, interpret decimal):

100: SLS1 exceeded.

200: SLS2 exceeded.

300: SLS3 exceeded.

400: SLS4 exceeded.

Remedy:

- check the traversing/motion program in the control.
- check the limits for "SLS" function and if required, adapt (p9331).

Note:
This message can be acknowledged using "Acknowledge internal event".
SLS: Safely Limited Speed
See also: p9331 (SI Motion SLS limit values (processor 2)), p9363 (SI Motion SLS stop response (processor 2))

C30716 **SI Motion P2: Tolerance for safe motion direction exceeded**

Message class: Safety monitoring channel has identified an error (10)
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The tolerance for the "safe motion direction" function was exceeded. The drive is stopped as a result of the configured stop response (p9366).
Message value (r2124, interpret decimal):
0: Tolerance for the "safe motion direction positive" function exceeded.
1: Tolerance for the "safe motion direction negative" function exceeded.

Remedy:

- check the traversing/motion program in the control.
- check the tolerance for "SDI" function and if required, adapt (p9364).

This message can be acknowledged as follows:

- Deselect the "SDI" function and select again.
- carry out safe acknowledgment via "Acknowledgment internal event".

C30770 **SI Motion P2: Discrepancy error affecting the failsafe inputs**

Message class: Safety monitoring channel has identified an error (10)
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The fail-safe digital inputs (F-DI) show a different state longer than that parameterized in p10002 / p10102.
Fault value (r0949, interpret binary):
Bit 0: Discrepancy error for F-DI 0
Bit 1: Discrepancy error for F-DI 1
...

Note:
If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs.

Remedy:

- check the wiring of the F-DI (contact problems).

Note:
This message can be acknowledged via F-DI or PROFIsafe.
Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10106, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally.
When the "Extended message acknowledgment" function (p9307.0) is active, the following applies:
If the F-DI assigned for STO or SS1 is in a fail-safe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed.
For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency.
If the period of a cyclic switching pulse corresponds to twice the value of p10102, then the following formulas should be checked:

- $p10102 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time)
- $p10102 \geq 12 \text{ ms}$ (discrepancy time must be no less than 12 ms)
- $p10102 > td$ (discrepancy time must be greater than the switch discrepancy time that may actually occur)

td = possible actual discrepancy time (in ms) that can occur with a switching operation. It must be at least 12 ms.
 tp = period for a switching operation in ms.

When debounce p10117 is active, the discrepancy time is directly specified by the debounce time.
If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked.

- $p10102 < p10117 + 1 \text{ ms} - t_d$
- $p10102 > t_d$
- $p10102 \geq 12 \text{ ms}$

Example:

For a 110 ms switching frequency and $p10117 = 0$, the maximum discrepancy time that can be set is as follows:

$$p10102 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$$

Rounded off, $p10102 \leq 36 \text{ ms}$ is obtained (as the discrepancy time is rounded off as a multiple of 12 ms).

Remedy:	- check the plug connections. - replace the encoder or encoder cable.

F31912	Encoder 1: Device combination is not permissible
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	ENCODER (IASC/DCBRK, NONE)
Acknowledge:	PULSE INHIBIT
Cause:	The selected device combination is not supported. Fault value (r0949, interpret decimal): 1003: The connected measuring unit cannot be operated with the EnDat 2.2 converter. For instance, the measuring unit has a pulse number/resolution of 2^n . 1005: The type of measuring unit (incremental) is not supported by the EnDat 2.2 converter. 1006: The maximum duration of the EnDat transfer (31.25 μ s) was exceeded. 2001: The set combination of current controller cycle, DP cycle and Safety cycle is not supported by the EnDat 2.2 converter. 2002: The resolution of the linear measuring unit does not match the pole pair width of the linear motor Pole pair width, minimum = $p0422 \cdot 2^{20}$ For fault value = 1003, 1005, 1006: - Use a measuring unit that is permissible. For fault value = 2001: - set a permissible cycle combination (if required, use standard settings). For fault value = 2002: - Use a measuring unit with a lower resolution (p0422).
Remedy:	
A31915 (F, N)	Encoder 1: Configuration error
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	The configuration for encoder 1 is incorrect. Alarm value (r2124, interpret decimal): 1: Re-parameterization between fault/alarm is not permissible. 419: When the fine resolution Gx_XIST2 is configured, the encoder identifies a maximum possible absolute position actual value (r0483) that can no longer be represented within 32 bits.
Remedy:	For alarm value = 1: No re-parameterization between fault/alarm. For alarm value = 419: Reduce the fine resolution (p0419) or de-activate the monitoring (p0437.25), if the complete multiturn range is not required.
A31930 (N)	Encoder 1: Data logger has saved data
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Reaction:	NONE
Acknowledge:	NONE
Cause:	For the activated function "Data logger" (p0437.0 = 1) a fault has occurred with the Sensor Module. This alarm indicates that the diagnostics data corresponding to the fault was saved on the memory card. The diagnostics data is saved in the following folder: /USER/SINAMICS/DATA/SMTRC00.BIN ... /USER/SINAMICS/DATA/SMTRC07.BIN /USER/SINAMICS/DATA/SMTRCIDX.TXT

The following information is contained in the TXT file:

- Display of the last written BIN file.
- Number of write operations that are still possible (from 10000 downwards).

Note:

Only Siemens can evaluate the BIN files.

Remedy:

Not necessary.

The alarm disappears automatically.

The data logger is ready to record the next fault case.

A31940 (F, N) Encoder 1: Spindle sensor S1 voltage incorrect

Message class: Application/technological function faulted (17)

Reaction: NONE

Acknowledge: NONE

Cause: The voltage of analog sensor S1 is outside the permissible range.

Fault value (r0949, interpret decimal):

Signal level from sensor S1.

Note:

A signal level of 500 mV corresponds to the numerical value 500 dec.

Remedy:

- check the clamped tool.
- check the tolerance and if required, adapt (p5040).
- check the thresholds and if required, adapt (p5041).
- check analog sensor S1 and connections.

F32142 (N, A) Encoder 2: Battery voltage fault

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)

Acknowledge: IMMEDIATELY

Cause: When switched-off, the encoder uses a battery to back up the multiturn information. The battery voltage is no longer sufficient to check the multiturn information.

Remedy:

Replace battery.

F32152 (N, A) Encoder 2: Maximum input frequency exceeded

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Reaction: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)

Acknowledge: PULSE INHIBIT

Cause: The maximum input frequency of the encoder evaluation has been exceeded.

Fault value (r0949, interpret decimal):

Actual input frequency in Hz.

Remedy:

- reduce the speed.
- Use an encoder with a lower pulse number (p0408).

F32160 (N, A) Encoder 2: Analog sensor channel A failed

Message class: Actual position/speed value incorrect or not available (11)

Reaction: OFF1 (IASC/DCBRK, NONE)

Acknowledge: PULSE INHIBIT

Cause: The input voltage of the analog sensor is outside the permissible limits.

Fault value (r0949, interpret decimal):

1: Input voltage outside detectable measuring range.

2: Input voltage outside the measuring range set in (p4673).

3: The absolute value of the input voltage has exceeded the range limit (p4676).

Remedy:

For fault value = 1:

- check the output voltage of the analog sensor.

For fault value = 2:

- check the voltage setting for each encoder period (p4673).

For fault value = 3:

- check the range limit setting and increase it if necessary (p4676).

A50001 (F)	PROFINET configuration error
Message class:	Communication error to the higher-level control system (9)
Reaction:	NONE
Acknowledge:	NONE
Cause:	A PROFINET controller attempts to establish a connection using an incorrect configuring telegram. The "Shared Device" function has been activated (p8929 = 2). Alarm value (r2124, interpret decimal): 10: A/F-CPU configures mixed PZD/PROFIsafe telegram. 13: F-CPU and PROFIsafe is not activated (p9601.3). 15: PROFIsafe telegram of the F-CPU does not match the setting in p9501.30. See also: p9601
Remedy:	Check the configuration of the PROFINET controllers as well as the p8929 setting.

A50010 (F)	PROFINET: Consistency error affecting adjustable parameters
Message class:	Communication error to the higher-level control system (9)
Reaction:	NONE
Acknowledge:	NONE
Cause:	A consistency error was detected when activating the configuration (p8925) for the PROFINET interface. The currently set configuration has not been activated.

Alarm value (r2124, interpret decimal):

0: general consistency error

1: error in the IP configuration (IP address, subnet mask or standard gateway).

2: Error in the station names.

3: DHCP was not able to be activated, as a cyclic PROFINET connection already exists.

4: a cyclic PROFINET connection is not possible as DHCP is activated.

Note:

DHCP: Dynamic Host Configuration Protocol

See also: p8920 (PN Name of Station), p8921 (PN IP address), p8922 (PN Def Gateway), p8923 (PN Subnet Mask), p8924 (PN DHCP Mode)

Remedy: - check the required interface configuration (p8920 and following), correct if necessary, and activate (p8925).

or

- Reconfigure the station via the "Edit Ethernet node" screen form (e.g. with STARTER commissioning software).

See also: p8925 (PN interface configuration)

A50011 (F) Ethernet/IP: configuration error

Message class: Communication error to the higher-level control system (9)

Reaction: NONE

Acknowledge: NONE

Cause: An EtherNet/IP controller attempts to establish a connection using an incorrect configuring telegram. The telegram length set in the controller does not match the parameterization in the drive device.

Remedy: Check the set telegram length.

For p0922 not equal to 999, then the length of the selected telegram applies.

For p0922 = 999, the maximum interconnected PZD (r2067) applies.

See also: p0922 (PROFIdrive PZD telegram selection), r2067 (PZD maximum interconnected)

A50020 (F) PROFINET: Second controller missing

Message class: Communication error to the higher-level control system (9)

Reaction: NONE

Acknowledge: NONE

Cause: The PROFINET function "Shared Device" has been activated (p8929 = 2). However, only the connection to a PROFINET controller is present.

Remedy: Check the configuration of the PROFINET controllers as well as the p8929 setting.

F50510 FBLOCKS: Logon of the run-time group rejected

Message class: General drive fault (19)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: When the run-time groups of the free function blocks attempted to log on with the sampling time management, the logon of at least one run-time group was rejected.

Too many different hardware sampling times may have been assigned to the free function blocks.

Remedy: - check number of available hardware sampling times ($T_{\text{sample}} < 8 \text{ ms}$) (r7903).

F50511 FBLOCKS: Memory no longer available for free function blocks

Message class: General drive fault (19)

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: When the free function blocks were activated, more memory was requested than was available on the Control Unit.

Remedy: Not necessary.

A50513 (F) FBLOCKS: Run sequence value already assigned

Message class: General drive fault (19)

Reaction: NONE

Acknowledge: NONE

Cause: An attempt was made to assign a run sequence value already assigned to a function block on this drive object to another additional function block on the same drive object. A run sequence value can only be precisely assigned to one function block on one drive object.

Remedy: Set another value that is still available on this drive object for the run sequence.

A50517 FBLOCKS: Int. meas. active

Message class: General drive fault (19)

Reaction: NONE

Acknowledge: NONE

Cause: A Siemens internal measurement has been activated.

Remedy: Carry out a POWER ON (switch-off/switch-on) for the Control Unit involved.

F50518 FBLOCKS: Sampling time of free run-time group differs at download

Message class: General drive fault (19)

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: In the STARTER/SCOUT project that was downloaded, the hardware sampling time of a free run-time group ($1 \leq p20000[i] \leq 256$) was set to a value that was either too low or too high.

The sampling time must be between 1 ms and the value $r20003 - r20002$.

If the sampling time of the selected free run-time group is < 1 ms, the equivalent value of 1 ms is used.

If the value $\geq r20003$, then the sampling time is set to the next higher or the same software sampling time $\geq r21003$.

Fault value (r0949, interpret decimal):

Number of the p20000 index of the run-time group where the sampling time is incorrectly set.

Number of the run-time group = fault value + 1

Remedy:

- correctly set the sampling time of the run-time group.
- if required, take all of the blocks from the run-time group.

Note:

Fault F50518 only detects an incorrectly parameterized run-time group. If, after correcting p20000[i] in the project, this error occurs again at download, then the run-time group involved should be identified using the fault value (r0949) and the sampling time correctly set.

A.3 List of abbreviations

Note

The following list of abbreviations includes all abbreviations and their meanings used in the entire SINAMICS family of drives.

Abbreviation	Source of abbreviation	Significance
A		
A...	Alarm	Warning
AC	Alternating Current	Alternating current
ADC	Analog Digital Converter	Analog-Digital converter
AI	Analog Input	Analog input
AIM	Active Interface Module	Active Interface Module
ALM	Active Line Module	Active Line Module
AO	Analog Output	Analog output
AOP	Advanced Operator Panel	Advanced Operator Panel
APC	Advanced Positioning Control	Advanced Positioning Control
AR	Automatic Restart	Automatic restart
ASC	Armature Short Circuit	Armature short-circuit
ASCII	American Standard Code for Information Interchange	American coding standard for the exchange of information
AS-i	AS-Interface (Actuator Sensor Interface)	AS interface (open bus system in automation technology)
ASM	Asynchronmotor	Induction motor
B		
BB	Betriebsbedingung	Operation condition
BERO	-	Contactless proximity switch
BI	Binector Input	Binector input
BIA	Berufsgenossenschaftliches Institut für Arbeitssicherheit	BG-Institute for Occupational Safety and Health
BICO	Binector Connector Technology	Binector connector technology
BLM	Basic Line Module	Basic Line Module
BO	Binector Output	Binector output
BOP	Basic Operator Panel	Basic operator panel
C

JOG	Jogging	Jogging
K		
KDV	Kreuzweiser Datenvergleich	Data cross-check
KHP	Know-How Protection	Know-how protection
KIP	Kinetische Pufferung	Kinetic buffering
Kp	-	Proportional gain
KTY84	-	Temperature sensor
L		
L	-	Symbol for inductance
LED	Light Emitting Diode	Light emitting diode
LIN	Linearmotor	Linear motor
LR	Lageregler	Position controller
LSB	Least Significant Bit	Least Significant Bit
LSC	Line-side converter	Line-side converter

Abbreviation	Source of abbreviation	Significance
LSS	Line-Side Switch	Line-side switch
LU	Length Unit	Length unit
LWL	Lichtwellenleiter	Fiber-optic cable
M		
M	-	Symbol for torque
M	Masse	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as GND)
MB	Megabyte	Megabyte
MCC	Motion Control Chart	Motion Control Chart
MDI	Manual Data Input	Manual data input
MDS	Motor Data Set	Motor data set

Parameters

- Access level, 15
- Can be changed, 17
- Command data sets, 529
- Data type, 16
- Drive data sets, 531
- Encoder data sets, 539
- List for quick commissioning, 553
- List of all parameters, 26
- List of the binector inputs, 540
- List of the binector outputs, 544
- List of the connector inputs, 542
- List of the connector outputs, 545
- List of the connector/binector outputs, 549
- Motor data sets, 537
- Number, 13
- Number range, 23

- Power unit data sets, 539

- Unit group, 19

- Unit selection, 19

- Password for access level 4, 15

- PDS, Power unit Data Set, 18

- Process data, 582, 585

- PROFIBUS, 582, 585

- PROFIdrive, 582, 585

- PROFINET, 582, 585

- pxxxx, 13

Q

- Quick commissioning (parameters), 553

R

- Ramp-function generator, 646, 649

- Reaction to faults, 765

- Resetting faults, 772
